HARMONEERITUD STANDARDID

Toote nõuetele vastavuse seaduse kohaselt avaldab Eesti Standardikeskus oma veebilehel ja ametlikus väljaandes teavet harmoneeritud standardeid ülevõtvate Eesti standardite kohta.

Harmoneeritud standardiks nimetatakse EÜ direktiivide kontekstis ja toote nõuetele vastavuse seaduse mõistes Euroopa Komisjoni mandaadi alusel Euroopa standardimisorganisatsioonide poolt koostatud ja vastu võetud standardit.

Harmoneeritud standardite kasutamise korral eeldatakse enamiku vastavate direktiivide mõistes, et standardi kohaselt valmistatud toode täidab direktiivi olulisi nõudeid ning on seetõttu reeglina kõige lihtsam viis tõendada direktiivide oluliste nõuete täitmist. Harmoneeritud standardi täpne tähendus ja õiguslik staatus tuleneb siiski iga direktiivi tekstist eraldi ning võib direktiivist olenevalt erineda.

Lisainfo:

<http://www.newapproach.org/>

<http://ec.europa.eu/enterprise/policies/european-standards/harmonised-standards/>

Eesti Standardikeskus avaldab ametlikus väljaandes harmoneeritud standardeid ülevõtvate Eesti standardite kohta järgmist infot:

- harmoneeritud standardi staatuse saanud Eesti standardid
- harmoneeritud standardi staatuses olevate Eesti standardite kohta avaldatud märkused ja hoiatused, mida tuleb standardite järgimisel arvestada
- harmoneeritud standardi staatuse kaotanud Eesti standardid

Info esitatakse vastavate direktiivide kaupa.

HARMONEERITUD STANDARDEID ÜLEVÕTVAD EESTI STANDARDID

Direktiiv 1999/5/EÜ

Raadioseadmed ja telekommunikatsioonivõrgu lõppseadmed

Osa 2: Harmoneeritud EN R&TTE direktiivi artikli 3 lõike 2 alusel. / <i>Electromagnetic compatibility and Radio spectrum Matters (ERM); Short Range Devices (SRD); Radio equipment to be used in the 40 GHz to 246 GHz frequency range; Part 2: Harmonized EN covering the essential requirements of article 3.2 of the R&TTE Directive</i></p>	<p>11.04.2012</p>			<p>Artikli 3, lõige 2</p>

Märkus 1: Tavaliselt on kuupäevaks, mil asendatava standardi järgimisest tulenev vastavuseeldus kehtivuse kaotab, Euroopa standardiorganisatsiooni kehtestatud tühistamiskuupäev, kuid kõnealuste standardite kasutajate tähelepanu juhitakse asjaolule, et teataval erandjuhtudel võib olla ka teisiti.

Märkus 2.1: Uue (või muudetud) standardi käsitlusala on samasugune nagu asendataval standardil. Osutatud kuupäeval kaotab kehtivuse asendatava standardi järgimisest tulenev vastavuseeldus direktiivi oluliste nõuetega.

Märkus 3: Muudatuse puhul on viitestandard EVS-EN CCCC:AAAA, vajaduse korral selle varasemad muudatused ja osutatud uus muudatus. Asendatav standard (veerg 3) koosneb seega standardist EVS-EN CCCC:AAAA ja vajaduse korral selle varasematest muudatustest, kuid ei hõlma osutatud uut muudatust. Osutatud kuupäeval kaotab kehtivuse asendatava standardi järgimisest tulenev vastavuseeldus direktiivi oluliste nõuetega.

Direktiiv 2004/108/EÜ

Direktiiv 97/23/EÜ
Surveseadmed
(EL Teataja 2012/C 104/03)

Järgnev loetelu sisaldab viiteid surveseadmete ühtlustatud standarditele ja surveseadmete tootmisel kasutatavate materjalide ühtlustatud tugistandarditele. Surveseadmete tootmisel kasutatavate materjalide ühtlustatud tugistandardite puhul on olulistele ohutusnõuetele vastavuse eeldus piiratud standardi materjalide tehniliste andmetega ning ei hõlma materjalide sobivust konkreetse seadme puhul. Seetõttu tuleb hinnata materjalistandardis esitatud tehnilisi andmeid vastavalt konkreetse seadme konstruktsiooninõuetele, et kontrollida vastavust surveseadmeid käsitleva direktiivi peamistele ohutusnõuetele.

Harmoneeritud standardit ülevõtva Eesti standardi tähis ja pealkiri	Kuupäev, millal Eesti standardi aluseks oleva Euroopa standardi kohta on avaldatud viide EL Teatajas	Viide asendatavale Eesti standardile	Kuupäev, mil asendatava standardi järgimisest tulenev vastavuseeldus kaotab kehtivuse Märkus 1

UUED STANDARDID JA KAVANDID ARVAMUSKÜSITLUSEKS

EVS Teataja avaldab andmed uutest vastuvõetud Eesti standarditest ja avalikuks arvamusküsitluseks esitatud standardite kavanditest rahvusvahelise standardite klassifikaatori (ICS) järgi. Samas jaotises on toodud andmed nii eesti keeles avaldatud, kui ka jõustumisteatega Eesti standarditeks ingliskeelsetena vastuvõetud rahvusvahelistest ja Euroopa standarditest.

Eesmärgiga tagada standardite vastuvõtmine järgides konsensuse põhimõtteid, peab standardite vastuvõtmisele eelnema standardite kavandite avalik arvamusküsitlus, milleks ettenähtud perioodi jooksul (reeglina 2 kuud) on asjast huvitatuil võimalik tutvuda standardite kavanditega, esitada kommentaare ning teha ettepanekuid parandusteks.

Arvamusküsitlusele on esitatud:

1. Euroopa ja rahvusvahelised standardid ning standardikavandid, mis on kavas vastu võtta Eesti standarditeks jõustumisteatega. Kavandid on kättesaadavad reeglina inglise keeles EVS klienditeeninduses ning standardiosakonnas. EVS tehnilistel komiteedel on võimalik saada koopiaid oma käsituslusalaga kokkulangevatest standardite kavanditest EVS kontaktisiku kaudu.
2. Eesti algupäraste standardite kavandid, mis Eesti standardimisprogrammi järgi on jõudnud arvamusküsitluse etappi.

Arvamusküsitlusel olevate dokumentide loetelus on esitatud järgnev informatsioon standardikavandi või standardi kohta:

- Tähis (eesliide pr Euroopa ja DIS rahvusvahelise kavandi puhul)
- Viide identsele Euroopa või rahvusvahelisele dokumendile
- Arvamusküsitluse lõppkuupäev (arvamuste esitamise tähtaeg)
- Pealkiri
- Käsitusala
- Keelsus (en=inglise; et=eesti)

Kavandite arvamusküsitlusel on eriti oodatud teave kui rahvusvahelist või Euroopa standardit ei peaks vastu võtma Eesti standardiks (vastuolu Eesti õigusaktidega, pole Eestis rakendatav jt põhjustel). Soovitame arvamusküsitlusele pandud standarditega tutvuda igakuiselt kasutades EVS infoteenust või EVS Teatajat. Kui see ei ole võimalik, siis alati viimase kahe kuu nimekirjadega kodulehel ja EVS Teatajas, kuna sellisel juhul saate info kõigist hetkel kommenteerimisel olevatest kavanditest.

Kavanditega tutvumiseks palume saata vastav teade aadressile standardiosakond@evs.ee, kavandeid saab osta klienditeenindusest standard@evs.ee.

Vastavad vormid arvamuse avaldamiseks Euroopa ja rahvusvaheliste standardikavandite ning algupäraste Eesti standardikavandite kohta leiate EVS koduleheküljelt www.evs.ee.

Tähtaeg 29.06.2012

Bituumen ja bituumensideained. Terminoloogia

This European Standard defines terms for paving grade or industrial bitumen of various types and binders derived from bitumen. This standard is intended to cover materials only within the scope of CEN/TC 336, i.e. only bitumens and bituminous binders. It should consequently not extend to non-petroleum "hydrocarbon" binders such as coal tar and its derivatives or to natural asphalts. However, some definitions are given for some excluded materials and related terms. The corresponding terms were introduced only when they appeared in a definition of a product or process and when their definition was found necessary for understanding or for avoiding any ambiguity.

Tähtaeg 29.06.2012

Information technology - Generic cabling systems - Part 6: Distributed building services

This European Standard specifies generic cabling that supports a wide range of communication services within premises that comprise single or multiple buildings on a campus, many of which require the use of remote powered devices including telecommunications, energy management, environmental control, personnel management, personal information and alarms. The distribution of these services is provided to locations (e.g. for wireless access points, remote powered devices and building management systems) other than those specified in premises-specific standards in EN 50173 series by means of either: a) an overlay structure and configuration to that specified within EN 50173 series or b) a stand-alone structure and configuration. It covers balanced cabling and optical fibre cabling. This European Standard is based upon and references the requirements of EN 50173-1, and in addition specifies implementation options. Safety (electrical safety and protection, optical power, fire, etc.) and electromagnetic compatibility (EMC) requirements are outside the scope of this European Standard and are covered by other standards and regulations. However, information given in this European Standard may be of assistance in meeting these standards and regulations.

Meditsiiniseadmed. Kvaliteedijuhtimissüsteem. Normatiivsed nõuded

See rahvusvaheline standard täpsustab kvaliteedijuhtimissüsteemi nõudeid, kus organisatsioon peab näitama oma suutlikkust pakkuda meditsiiniseadmeid ja seotud teenuseid, mis vastavad järjekindlalt kliendi nõuetele ja normatiivsetele nõuetele, mida rakendatakse meditsiiniseadmetele ja seotud teenustele.

Selle rahvusvahelise standardi esmane eesmärk on lihtsustada meditsiiniseadmete kvaliteedijuhtimissüsteemide ühtlustatud normatiivseid nõudeid. Selle tulemusena sisaldab see mõnda konkreetset meditsiiniseadmete kohta käivat normatiivset nõuet ja jätab välja mõned normatiivseteks nõueteks mittesobivad standardi ISO 9001:2000 nõuded. Nende väljajätmiste tõttu ei saa organisatsioonid, kelle kvaliteedijuhtimissüsteem on vastavuses selle rahvusvahelise standardiga, taotleda vastavust standardile ISO 9001:2000, kuni nende kvaliteedijuhtimissüsteem on vastavuses kõigi standardi ISO 9001:2000 nõuetega (vt lisa B).

Raudteealased rakendused. Liinikategooriad veeremi ja infrastruktuuri piirkormuste vahelise ühilduvuse määramiseks

Käesolevas Euroopa standardis on kirjeldatud olemasolevate raudteeliinide ja raudteeveeremi liigitusmeetodeid. Standardis on kindlaks määratud tehnilised nõuded veeremi ja infrastruktuuri omaduste ühilduvuse tagamiseks. Standard sobib ühilduvuse tagamiseks kaubaveo-, reisijateveo- ja segaveoliinidel ning sisaldab nõudeid seoses: - raudtee infrastruktuuri vertikaalkandevõime liigitamisega; - raudteeveeremi konstruktsiooniga; - kaubavagunite suurima lubatud kasuliku koormuse kindlakstegemisega. Infrastruktuuri ja veeremi liigitamise kokkuvõtte on antud lisas B. Rööbastee teerajatiste, pealisehitiste ja muldkehade vertikaalkandevõime hindamine lisas A kindlaksmääratud koormusmudelite kasutamise võimaldab liigitada infrastruktuuri liinikategooriatesse. Käesolevas Euroopa standardis on kirjeldatud veeremi ja raudteeliinide infrastruktuuri ühilduvuse kindlakstegemist tavaliste talitusolude korral vertikaalkoormusmõjudega seotud täiendavate kontrollimisteta. Standardis kirjeldatud meetodika ei ole kasutatav kiirraudteeliinide suhtes. Standardi käsitusallas ei kuulu ka kallutava kerega veerem ning rööbasmasinad ja rööbaskraanad. Standardis ei ole käsitletud Suurbritannias kasutatavat kõikide liinide ja raudteeveeremi liigitamiseks kasutatavat RA-süsteemi (Route Availability System). RA-süsteemile vastava liigituse ja käesolevale standardile vastavate liinikategooriate vastavus on antud lisas C. Standardis ei ole käsitletud rongi suurima kogumassiga ega rongi suurima pikkusega seotud nõudeid. Standardis sätestatud nõuded ei asenda suurimaid lubatud ratta/rööpa dünaamilisi kontaktjõude, veeremi sõiduomadusi, veeremi konstruktsiooniga seotud piiranguid jms käsitlevaid eeskirju.

Protection against lightning - Thunderstorm warning systems

This European Standard provides the basic requirements of sensors and networks collecting accurate data of the relevant parameters informing in real-time about lightning tracking and range. It describes the application of the data collected by these sensors and networks in the form of warnings and historical data. This European Standard applies to the use of information from thunderstorm warning systems (which are systems or equipment which provide real-time information) on atmospheric electrical activity in order to monitor for preventive means. The scope of this document is providing: - a general description of the available lightning and storm electrification hazard warning systems; - a classification of thunderstorm detection devices and properties; - guidelines for alarming methods; - a procedure to determine the thunderstorm information usefulness; - some examples of possible preventive actions (only for information).

Medical electrical equipment - Dosimeters with ionization chambers as used in radiotherapy

This International Standard specifies the performance requirements of RADIOTHERAPY DOSIMETERS, intended for the measurement of ABSORBED DOSE TO WATER or AIR KERMA (and their rates and spatial distributions) in PHOTON, ELECTRON, proton or heavy ion RADIATION FIELDS as used in RADIOTHERAPY. The DOSE MONITORING SYSTEMS incorporated in RADIOTHERAPY treatment machines are not covered by this standard, neither are the re-entrant IONIZATION CHAMBERS used for BRACHYTHERAPY source calibration and constancy check devices. This standard is applicable to the following types of dosimeter: a) FIELD-CLASS DOSIMETERS normally used for 1) the measurement of KERMA or dose in a RADIATION BEAM, either in air or in a PHANTOM; 2) in vivo skin surface or intracavitary measurements of dose on PATIENTS. b) REFERENCE-CLASS DOSIMETERS normally used for the calibration of FIELD-CLASS DOSIMETERS; NOTE REFERENCE-CLASS DOSIMETERS may be used as FIELD-CLASS DOSIMETERS. c) SCANNING-CLASS DOSIMETERS normally used for relative dose distribution measurements with a SCANNING SYSTEM such as an automatic water PHANTOM.

Meditsiiniseadmed. Kvaliteedijuhtimissüsteem. Normatiivsed nõuded

See rahvusvaheline standard täpsustab kvaliteedijuhtimissüsteemi nõudeid, kus organisatsioon peab näitama oma suutlikkust pakkuda meditsiiniseadmeid ja seotud teenuseid, mis vastavad järjekindlalt kliendi nõuetele ja normatiivsetele nõuetele, mida rakendatakse meditsiiniseadmetele ja seotud teenustele.

Selle rahvusvahelise standardi esmane eesmärk on lihtsustada meditsiiniseadmete kvaliteedijuhtimissüsteemide ühtlustatud normatiivseid nõudeid. Selle tulemusena sisaldab see mõnda konkreetset meditsiiniseadmete kohta käivat normatiivset nõuet ja jätab välja mõned normatiivseteks nõueteks mittesobivad standardi ISO 9001:2000 nõuded. Nende väljajätmiste tõttu ei saa organisatsioonid, kelle kvaliteedijuhtimissüsteem on vastavuses selle rahvusvahelise standardiga, taotleda vastavust standardile ISO 9001:2000, kuni nende kvaliteedijuhtimissüsteem on vastavuses kõigi standardi ISO 9001:2000 nõuetega (vt lisa B).

Ophthalmic instruments - Corneal topographers (ISO 19980:2012)

This International Standard specifies minimum requirements for instruments and systems that fall into the class of corneal topographers (CTs). It also specifies tests and procedures to verify that a system or instrument complies with this International Standard and thus qualifies as a CT according to this International Standard. It also specifies tests and procedures that allow the verification of capabilities of systems that are beyond the minimum requirements for CTs. This International Standard defines terms that are specific to the characterization of the corneal shape so that they may be standardized throughout the field of vision care. This International Standard is applicable to instruments, systems and methods that are intended to measure the surface shape of the cornea of the human eye. NOTE The measurements can be of the curvature of the surface in local areas, three-dimensional topographical measurements of the surface or other more global parameters used to characterize the surface. It is not applicable to ophthalmic instruments classified as ophthalmometers.

Health informatics - Personal health device communication - Part 10421: Device specialization - Peak expiratory flow monitor (peak flow) (ISO/FDIS 11073-10421:2012)

The scope of this standard is to establish a normative definition of communication between personal telehealth peak flow monitoring devices (agents) and managers (e.g., cell phones, personal computers, personal health appliances, and set top boxes) in a manner that enables plug-and-play interoperability. It leverages work done in other ISO/IEEE 11073 standards including existing terminology, information profiles, application profile standards, and transport standards. It specifies the use of specific term codes, formats, and behaviors in telehealth environments restricting optionality in base frameworks in favor of interoperability. This standard defines a common core of functionality of a peak-flow monitoring device. The use case is restricted to personal respiratory monitoring and therefore does not include hospital-based spirometry. Continuous and high-acuity monitoring (e.g., for emergency response) are outside the scope of the use case.

Road restraint systems - Part 6: Pedestrian restraint system - Pedestrian parapets

This Technical Report specifies geometrical and technical requirements for the design and manufacture for pedestrian parapets on road bridges, on footbridges, on top of retaining walls and on similar elevated structures. This Technical Report also specifies test methods and provision for the labelling and marking of these products. This Technical Report does not cover: - vehicle restraint systems; - pedestrian restraint systems in residential, commercial or industrial buildings and within their perimeter; - non-rigid rails i.e. rope, cables. This Technical Report may be used for pedestrian parapets on structures which cross over railways, rivers and canals.

Identne CEN/TS 1317-8:2012

Road restraint systems - Part 8: Motorcycle road restraint systems which reduce the impact severity of motorcyclist collisions with safety barriers

This Technical Specification specifies requirements for the impact performance of systems designed for the reduction of impact severity for PTW riders impacting safety barriers whilst sliding along the ground, having fallen from their PTW vehicle. The protection systems concerned are those fitted to barriers or barriers that have an inherent PTW rider protection or risk reduction capability. This Technical Specification excludes the assessment of the vehicle restraint capabilities of barriers and the risk that they represent to the occupants of impacting cars. The assessment of performance of impacting vehicles is covered by EN 1317-1 and EN 1317-2. This Technical Specification defines performance classes taking into account rider speed classes, impact severity and the working width of the system with respect to rider impacts. For systems designed to be added to a standard barrier, the test results are valid only when the system is fitted to the model of barrier used in the tests since the performance will not necessarily be the same if the system is fitted to a different barrier.

Alarm systems - Intrusion and hold-up systems - Part 2-8: Intrusion detectors - Shock detectors

This Technical Specification is for shock detectors installed in buildings to detect the shock or series of shocks due to a forcible attack through a physical barrier (for example doors or windows). It provides for security Grades 1-4 (see EN 50131-1), specific or non specific wired or wire-free detectors and uses Environmental Classes i-iv (see EN 50130-5). This Technical Specification does not include requirements for detectors intended to protect for example vaults and safes from penetration attacks from e.g. drilling, cutting or thermal lance. This Technical Specification does not include requirements for shock detectors intended for use outdoors. A detector shall fulfil all the requirements of the specified grade. Functions additional to the mandatory functions specified in this Technical Specification may be included in the detector, providing they do not adversely influence the correct operation of the mandatory functions. This Technical Specification does not apply to system interconnections.

Specification for portable electrical apparatus designed to measure combustion flue gas parameters of heating appliances - Part 1: General requirements and test methods

This European Standard covers apparatus for measuring gas concentrations and other combustion parameters, as used in the installation and maintenance of heating appliances. Such apparatus may be used for testing the performance of appliances for different types of fuels, either by the installer, maintenance engineer or inspector. The apparatus may consist of different functional modules, which may be tested separately for complying with this standard and will be combined in different ways according to the different applications.

This part of EN 50379 specifies the general requirements and is supplemented by the requirements in EN 50379-2 and/or EN 50379-3. This European Standard specifies general requirements for the construction, testing and performance of portable spot reading apparatus designed to give an assessment of specific combustion flue gas parameters, such as concentration of gaseous compounds, temperature and/or pressure, to check the combustion performance of heating appliances for domestic residential and commercial applications, using commercially available fuels. This European Standard excludes apparatus for - continuous emission, safety monitoring and control, and - use in vessels with an international load line.

Ergonomics of the physical environment - Assessment of environments by means of an environmental survey involving physical measurements of the environment and subjective responses of people (ISO 28802:2012)

This International Standard provides an environmental survey method for the assessment of the comfort and well-being of occupants of indoor and outdoor environments. It is not restricted to any particular environment, but provides the general principles that allow assessment and evaluation. It presents the principles for conducting an environmental survey to assess the comfort and well-being of people in environments. It gives guidance on the design of the survey, as well as on the environmental measurements used to quantify the environment and the subjective assessment methods used to quantify the occupants' responses to that environment. It does not provide guidance on the design of subjective scales. It is applicable to built as well as other environments, including vehicle and outdoor environments, and to all the occupants of those environments who can be considered as providing valid responses to an environmental survey. There may be specific features of certain types of environment that have to be taken into account; however, the general principles it outlines will apply. This International Standard is not restricted to specific environmental components. It includes assessment of thermal environments, the acoustic environment, the visual and lit environment, air quality and other environmental factors that could be considered to influence the comfort and well-being of the occupants of an environment. It is a basic ergonomics standard which can contribute to the development of standards concerned with specific environments such as those found in buildings. It is intended to be used by people involved in the general assessment and evaluation of physical environments, including general ergonomics practitioners as well as those who develop standards and guidelines for specific applications.

Ergonomics of the physical environment - Application of international standards to people with special requirements (ISO 28803:2012)

This International Standard describes how International Standards concerned with the ergonomics of the physical environment can be applied for people with special requirements, who would otherwise be considered to be beyond the scope of those standards. It has been produced according to the principles of accessible design provided in ISO/IEC Guide 71 and using the data provided in ISO/TR 22411. It is not restricted to any specific environment but provides the general principles that allow assessment and evaluation, and can contribute to the development of standards concerned with specific environments. It is applicable to built environments as well as to other indoor, vehicle and outdoor environments. Nor is it restricted to specific environmental components; it includes assessment of acoustic environments, thermal environments, lighting, air quality and other environmental factors that could be considered to influence the health, comfort and performance of people with special requirements in an environment. It is applicable to all occupants of such environments who can be considered to have special requirements.

Tests for chemical properties of aggregates - Part 8: Sorting test to determine metal content of Municipal Incinerator Bottom Ash (MIBA) Aggregates

This European Standard specifies a simple method for the examination of Municipal Incinerator Bottom Ash (MIBA) Aggregates for the purpose of estimating the relative proportions of metallic constituents. This European standard describes the reference methods use for type testing and in case of dispute for estimating the relative proportions of aluminium or other metallic constituents of MIBA Aggregates. For other purposes, in particular factory production control, other methods may be used provided that an appropriate working relationship with the reference method has been established.

Fire hazard testing - Part 9-1: Surface spread of flame - General guidance

This part of IEC 60695 provides guidance for the assessment of surface spread of flame for electrotechnical products and the materials from which they are formed. It provides: - an explanation of the principles of flame spread for both liquids and solids, - guidance for the selection of test methods, - guidance on the use and interpretation of test results, and - informative references. This basic safety publication is intended for use by technical committees in the preparation of standards in accordance with the principles laid down in IEC Guide 104 and ISO/IEC Guide 51. One of the responsibilities of a technical committee is, wherever applicable, to make use of basic safety publications in the preparation of its publications. The requirements, test methods or test conditions of this basic safety publication will not apply unless specifically referred to or included in the relevant publications.

Konveierilindid. Süttivuskatsed tulesimulatsiooniga. Osa 1: Katsed propaanipõletiga

This part of EN 12881 describes three methods for measuring the propagation of a flame along a conveyor belt which has been exposed to a relatively high localised heat source such as a fire. The damage suffered by the conveyor belt, as well as its tendency to support combustion, is measured by observing the extent to which the fire spreads along the test piece. Method A uses a test piece 2 m in length and consumes propane gas through the burner at the rate of $(1,30 \pm 0,05)$ kg per 10 min. Method B uses a test piece 1,5 m in length and consumes propane gas through the burner at the rate of (565 ± 10) g per 50 min. Method C uses a test piece 1,2 m in length and consumes propane gas through the burner at the rate of 150 l per hour (D1) or 190 l per hour (D2).

Test methods for determining the contribution to the fire resistance of structural members - Part 2: Vertical protective membranes

This part of this European Standard specifies a test method for determining the ability of a vertical protective membrane, when used as a fire resistant barrier, to contribute to the fire resistance (loadbearing capacity R) of loadbearing vertical structural building members fabricated from steel, concrete, steel/concrete composites or timber. The method described is applicable to any type of vertical protective membrane, which can be associated with a separate bracing membrane. The vertical protective membrane can be separate from the structural building member and is self-supporting. This test method is applicable to vertical protective membranes where there is a separating gap of at least 5 mm size between the vertical protective membrane and the structural building member, otherwise alternative test methods prEN 13381-3, prEN 13381-4, FprEN 13381-6 or ENV 13381-7 shall be used as appropriate. This test method and assessment is not applicable to the following: a) all situations where the cavity is to be used as a service or ventilation shaft; b) all situations where the vertical protective membrane acts as a bracing membrane.

Soil quality - Effects of pollutants on Enchytraeidae (Enchytraeus sp.) - Determination of effects on reproduction (ISO/DIS 16387:2012)

This part of ISO 16387 specifies one of the methods for evaluating the habitat function of soils and determining effects of soil contaminants and chemicals on the reproduction of Enchytraeus sp. by dermal and alimentary uptake in a chronic test. It is applicable to soils and soil materials of unknown quality e.g. from contaminated sites, amended soils, soils after remediation, agricultural or other sites under concern and waste materials. Effects of substances are assessed using a standard soil, preferably a defined artificial soil substrate. For contaminated soils, the effects are determined in the test soil and in a control soil. According to the objective of the study, the control and dilution substrate (dilution series of contaminated soil) should be either an uncontaminated soil comparable to the soil sample to be tested (reference soil) or a standard soil (e.g. artificial soil). Information is provided how to use this method for testing chemicals under temperate conditions. The method is not applicable to volatile substances, i.e. substances for which H (Henry's constant) or the air/water partition coefficient is greater than 1, or for which the vapour pressure exceeds 0,013 3 Pa at 25 °C. NOTE No provision is made in the test method for monitoring the persistence of the substance under test. WARNING - Contaminated soils may contain unknown mixtures of toxic, mutagenic, or otherwise harmful chemicals or infectious micro-organisms. Occupational health risks may arise from dust or evaporated chemicals as well as via dermal contact during handling and incubation.

Soil quality - Digital exchange of soil-related data (ISO/DIS 28258:2012)

This International Standard describes how to digitally exchange soil-related data. It aims to facilitate the exchange of valid, clearly described and specified soil-related data between individuals and organizations via digital systems and enables any soil data producer, holder or user to find and transfer data in an unambiguous way. This International Standard contains definitions of features, several parameter specifications and encoding rules that allow consistent and retrievable data exchange. It also allows to explicitly geo-reference soil data by building on existing ISO standards, thus facilitating the use of soil data within geographical information systems (GIS). Because soil data are of various origin and obtained according to a huge variety of description and classification systems, this International Standard provides no attribute catalogue, but a flexible approach to the unified encoding of soil data by implementing the rules of ISO 19156-2 observations and measurements (O & M) for the use in soil science. Figure 1 shows the fluxes of soil data, generic to many kinds of applications that can be organized by using the rules of this International standard.

Electroacoustics - Hearing aids - Part 15: Methods for characterising signal processing in hearing aids with a speech-like signal

International Speech Test Signal (ISTS), together with the procedures and the requirements for measuring the characteristics of signal processing in air-conduction hearing aids. The measurements are used to derive the estimated insertion gain (EIG). For the purposes of characterizing a hearing aid for production, supply and delivery, the procedures and requirements to derive the coupler gain on a 2 cm³ coupler as defined in IEC 60318-5 are also specified. The procedure uses a speech-like test signal and the hearing aid settings are set to those programmed for an individual end-user or those recommended by the manufacturer for a typical end-user for a range of flat, moderately sloping or steep sloping audiograms, so that the measured characteristics are comparable to those which may be obtained by a wearer at typical user settings. The purpose of this standard is to ensure that the same measurements made on a hearing aid following the procedures described, and using equipment complying with these requirements, give substantially the same results. Measurements of the characteristics of signal processing in hearing aids which apply nonlinear processing techniques are valid only for the test signal used. Measurements which require a different test signal or test conditions are outside the scope of this standard. Conformance to the specifications in this standard is demonstrated only when the result of a measurement, extended by the actual expanded uncertainty of measurement of the testing laboratory, lies fully within the tolerances specified in this standard as given by the values given in 6.1. Measurement methods that take into account the acoustic coupling of a hearing aid to the individual ear and the acoustic influence of the individual anatomical variations of an end-user on the acoustical performance of the hearing aid, known as real-ear measurements, are outside the scope of this particular standard.

Short-circuit currents - Calculation of effects - Part 1: Definitions and calculation methods

This part of IEC 60865 is applicable to the mechanical and thermal effects of short-circuit currents. It contains procedures for the calculation of - the electromagnetic effect on rigid conductors and flexible conductors, - the thermal effect on bare conductors. For cables and insulated conductors, reference is made, for example, to IEC 60949 and IEC 60986. For the electromagnetic and thermal effects in d.c. auxiliary installations of power plants and substations reference is made to IEC 61660-2. Only a.c. systems are dealt with in this standard. The following points should, in particular, be noted: a) The calculation of short-circuit currents should be based on IEC 60909. For the determination of the greatest possible short-circuit current, additional information from other IEC standards may be referred to, e.g. details about the underlying circuitry of the calculation or details about current-limiting devices, if this leads to a reduction of the mechanical stress. b) Short-circuit duration used in this standard depends on the protection concept and should be considered in that sense. c) These standardized procedures are adjusted to practical requirements and contain simplifications which are conservative. Testing or more detailed methods of calculation or both may be used. d) In Clause 5 of this standard, for arrangements with rigid conductors, only the stresses caused by short-circuit currents are calculated. Furthermore, other stresses can exist, e.g. caused by dead-load, wind, ice, operating forces or earthquakes. The combination of these loads with the short-circuit loading should be part of an agreement and/or be given by standards, e.g. erection-codes. The tensile forces in arrangements with flexible conductors include the effects of deadload. With respect to the combination of other loads the considerations given above are valid. e) The calculated loads are design loads and should be used as exceptional loads without any additional partial safety factor according to installation codes of, for example, IEC 61936-1 [1]1.

This International Standard specifies methods for measuring the sound pressure levels on a measurement surface enveloping a noise source (machinery or equipment) in an anechoic room or a hemi-anechoic room. The sound power level (or, in the case of impulsive or transient noise emission, the sound energy level) produced by the noise source, in frequency bands of width one-third octave or with frequency weighting A applied, is calculated using those measurements, including corrections to allow for any differences between the meteorological conditions at the time and place of the test and those corresponding to a reference characteristic acoustic impedance. In general, the frequency range of interest includes the one-third-octave bands with mid-band frequencies from 100 Hz to 10 000 Hz. In practice, the range is extended or restricted to frequencies beyond or within these limits, to those between which the test room is qualified for the purposes of the measurements.

Electrical insulating materials - Thermal endurance properties - Part 1: Ageing procedures and evaluation of test results

This part of IEC 60216 specifies the general ageing conditions and procedures to be used for deriving thermal endurance characteristics and gives guidance in using the detailed instructions and guidelines in the other parts of the standard. Although originally developed for use with electrical insulating materials and simple combinations of such materials, the procedures are considered to be of more general applicability and are widely used in the assessment of materials not intended for use as electrical insulation. In the application of this standard, it is assumed that a practically linear relationship exists between the logarithm of the time required to cause the predetermined property change and the reciprocal of the corresponding absolute temperature (Arrhenius relationship). For the valid application of the standard, no transition, in particular no first-order transition should occur in the temperature range under study. Throughout the rest of this standard the term "insulating materials" is always taken to mean "insulating materials and simple combinations of such materials".

Influence of materials on water for human consumption - Enhancement of microbial growth (EMG)

This European Standard specifies procedures for determining the ability of non-metallic materials to promote the growth of microorganisms. This standard is applicable to those materials destined to be used under various conditions for the transport and storage of water intended for human consumption. The Standard allows for the testing of a single type of material, or a product in which only one material is in contact with water. It is unsuitable for use with assembled products where more than one material is exposed to water.

Electricity metering equipment - Dependability - Part 32-1: Durability - Testing of the stability of metrological characteristics by applying elevated temperature

The stability of metrological characteristics is one important aspect of durability. This part of IEC 62059 specifies a method for testing the stability of metrological characteristics of electricity meters, by operating a test specimen at the upper limit of the specified operating range of temperature, voltage and current for an extended period. Functional performance other than the accuracy of energy measurement is out of the scope of this standard. Note, that from the results of this test, no conclusion can be drawn for the length of period during which the stability of the metrological characteristics will be maintained when the meter is operated under usual conditions. This International Standard is applicable to all types of electricity meters in the scope of IEC TC 13.

This European Standard deals with the special technical safety requirements for liquid pumps and pump units operating with agrifood-stuff. This European Standard is intended to be used with EN 809 to give the additional requirements for hazards arising from the pumping of substances intended for human and domestic animal consumption (see Clause 4). This European Standard also establishes requirements and/or measures for the reduction of risks during use, including misuse foreseeable by the manufacturer. This European Standard is not intended to be used for pumps and pump units at any stage in the public water supply, nor for pumps handling pharmaceutical products, nor for any other application for which more appropriate standards exist. The pumps and pump units covered by this European Standard are the following: - rotodynamic pumps; - rotary positive displacement pumps; - reciprocating positive displacement pumps. Pumps dealing with agrifood-stuff which are not indicated in this scope are potentially covered by EN 1672-2:2005+A1:2009. This document is not applicable to liquid pumps for agrifoodstuff applications which are manufactured before the date of its publication as an EN.

Gas cylinders - Cylinder bundles - Design, manufacture, testing and inspection (ISO 10961:2010)

This International Standard specifies the requirements for the design, construction, testing and initial inspection of a transportable cylinder bundle. It is applicable to cylinder bundles containing compressed gas, liquefied gas and mixtures thereof. It is also applicable to cylinder bundles for acetylene. This International Standard does not apply to packages in which cylinders are manifolded together in a support frame which is designed to be fixed permanently to a road vehicle, to a railway wagon or to the ground as a customer storage vessel. It does not apply to cylinder bundles which are designed for use in extreme environmental or operational conditions when additional and extraordinary requirements are imposed to maintain safety standards, reliability and performance, e.g. offshore cylinder bundles. Some special applications (e.g. electronics) require an alternative design approach. With the agreement of the inspection body, the manifold and its piping components may be designed and tested at a pressure which is appropriate to the service conditions. Specific requirements for acetylene cylinder bundles containing acetylene in a solvent are included in Annex B. This International Standard does not, however, cover acetylene cylinder bundles with solvent-free acetylene cylinders. This International Standard is intended primarily for industrial gases other than liquefied petroleum gases (LPGs), but it may also be used for LPGs. Unless otherwise stated, individual cylinders within cylinder bundles will have to conform to applicable standards for single cylinders. This International Standard specifies the additional requirements that apply when individual cylinders are assembled into a bundle.

This European Standard is concerned with the special technical safety requirements for liquid pumps and pump units operating with agrifoodstuffs. It augments EN 809 and contains a list of the additional significant hazards which can arise from the pump and pump units used with substances intended for human and domestic animal consumption. In drafting this standard it was assumed that the pumps falling within its scope will conform to all relevant requirement of EN 809. It also establishes requirements and/or measures which lead to a reduction of the risks. This standard is not intended to be used for pumps and pump units at any stage in the public water supply, nor for pumps handling pharmaceutical products, nor for any other application for which more appropriate standards can exist.

Käesolev standard annab juhiseid metallist gaasiballooni, ventiilimaterjali ja sisalduva gaasi koostise kokkusobivuse valikuks ning hindamiseks. Antud kokkusobivuse andmed kehtivad ühekomponendilise gaasi korral. Standard on kohaldatav õmblusteta ja keevitatud gaasiballoonidele, mis on arvestatud kasutamiseks kokkusurutud, veeldatud ja lahustatud gaasidega. Tarnitud toote kvaliteediküsimusi ei ole arvesse võetud.

Copper and copper alloys - Seamless, round copper capillary tubes

This European Standard specifies the composition, property requirements and tolerances on dimensions and on form for seamless round copper capillary tubes for use as metering lines for liquids or gases where close controls over the smoothness and dimensions of the bore are required to ensure uniform flow characteristics. This European Standard applies to capillary tubes in straight lengths, or in coils, in the size range up to and including 6,10 mm outside diameter and from 0,30 mm up to and including 4,45 mm inside diameter which are intended for restrictor applications. The sampling procedures and the methods of test for verification of conformity to the requirements of this European Standard are also specified.

Gas cylinders - Acetylene cylinder bundles - Filling conditions and filling inspection (ISO 13088:2011)

This International Standard specifies the minimum requirements for the filling conditions and filling inspection of acetylene cylinder bundles. It applies both to bundles which are filled while the cylinders are assembled in the bundle and to bundles of which the cylinders are filled as individual cylinders and are assembled into a bundle after filling. It does not apply to bundles containing solvent-free acetylene cylinders. This International Standard is not applicable to individual acetylene cylinders that are not intended to be assembled into a bundle (see ISO 11372).

Gas cylinders - High pressure cylinders for the on-board storage of natural gas as a fuel for automotive vehicles (ISO/DIS 11439:2012)

This International Standard specifies minimum requirements for serially produced light-weight refillable gas cylinders intended only for the on-board storage of high pressure compressed natural gas as a fuel for automotive vehicles to which the cylinders are to be fixed. The service conditions do not cover external loadings that can arise from vehicle collisions, etc. This International Standard covers cylinders of any steel, aluminium or non-metallic material construction, using any design or method of manufacture suitable for the specified service conditions. This International Standard does not cover cylinders of stainless steel or of welded construction. Although this standard uses 200 bar as a reference working pressure, other working pressures can be used. Cylinders covered by this International Standard are designated Type 1, Type 2, Type 3 and Type 4.

Automation systems in the process industry - Factory acceptance test (FAT), site acceptance test (SAT) and site integration test (SIT)

This International Standard defines procedures and specifications for the Factory Acceptance Test (FAT), the Site Acceptance Test (SAT), and the Site Integration Test (SIT). These tests are carried out to prove that the automation system is in accordance with the specification. Engineering and manufacturing activities prior to these tests are not covered by this standard. For application in the pharmaceutical or other highly specialized industries, additional guidelines (for example, Good Automated Manufacturing Practice (GAMP)), definitions and stipulations should apply in accordance with existing standards, for example, for GMP Compliance 21 CFR (FDA) and the Standard Operating Procedure of the European Medicines Agency (SOP/INSP/2003). The description of activities given in this standard can be taken as a guideline and adapted to the specific requirements of the process, plant or equipment. A typical sequence of activities and events is shown in Figure 1, and their relationship are shown in Figures 2 and Figure 3.

Industrial communication networks - High availability automation networks - Part 4: Cross-network Redundancy Protocol (CRP)

The IEC 62439 series is applicable to high-availability automation networks based on the ISO/IEC 8802-3 (IEEE 802.3) (Ethernet) technology. This part of the IEC 62439 series specifies a redundancy protocol that is based on the duplication of the network, the redundancy protocol being executed within the end nodes, as opposed to a redundancy protocol built in the switches. The switchover decision is taken in each node individually. The cross-network connection capability enables single attached end nodes to be connected on either of the two networks.

Welding and allied processes - Determination of hydrogen content in arc weld metal (ISO 3690:2012)

This International Standard specifies the sampling and analytical procedure for the determination of diffusible hydrogen in martensitic, bainitic, and ferritic steel weld metal arising from the welding of such steels using arc welding processes with filler metal. The techniques specified in this International Standard include collection of diffusible hydrogen via displacement of mercury or collection into a headspace filled with an inert gas such as argon. The amount of hydrogen collected is determined by measuring the displaced volume in the former and by, for example, thermal conductivity in the latter. The temperature for collection of diffusible hydrogen is controlled to avoid thermal activation of non-diffusible hydrogen.

Transmitters for using in industrial-process control systems - Part 3: Methods for performance evaluation of intelligent transmitters

This part of IEC 60770 specifies the following methods. - Methods for - assessment the functionality of intelligence transmitters; - testing the operational behaviour, as well as the static and dynamic performance of an intelligent transmitter. - Methodologies for - determining the reliability and diagnostic features used to detect malfunctions; - determining the communication capabilities of the intelligent transmitters in a communication network. The methods and methodologies are applicable to intelligent transmitters, which convert one or more physical, chemical or electrical quantities into digital signals for use in a communication network (as specified in the IEC 61158 series or others) or into analogue electrical signals (as specified in the IEC 60381 series). The methods and methodologies listed in this part of IEC 60770 are intended for use by: - manufacturers to determine the performance of their products and - users or independent testing laboratories to verify equipment performance specifications. Manufacturers of intelligent transmitters are urged to apply this part of IEC 60770 at an early stage of development. This standard is intended to provide guidance for designing evaluations of intelligent transmitters by providing: - a checklist for reviewing the hardware and software design in a structured way; - test methods for measuring and qualifying the performance, dependability and operability under various environmental and operational conditions; - methods for reporting the data obtained.

Industrial communication networks - High availability automation networks - Part 3: Parallel Redundancy Protocol (PRP) and High-availability Seamless Redundancy (HSR)

The IEC 62439 series is applicable to high-availability automation networks based on the ISO/IEC 8802-3 (Ethernet) technology. This part of the IEC 62439 series specifies two redundancy protocols designed to provide seamless recovery in case of single failure of an inter-bridge link or bridge in the network, which are based on the same scheme: duplication of the LAN, resp. duplication of the transmitted information.

Heat shrinkable low and medium voltage moulded shapes - Part 1: General requirements

This standard is applicable to heat shrinkable low and medium voltage moulded shapes in a range of configurations and materials suitable for insulation, environmental sealing, mechanical protection, electrical conductance, anti tracking and strain relief for power cable terminations, joints and stop ends. It specifies the test methods and material requirements. The most commonly available shapes are as shown in the Annex A. Materials which conform to this specification meet established levels of performance. However, the selection of a material by a user for a specific application should be based on the actual requirements necessary for adequate performance in that application and not based on this specification alone. These moulded shapes are designed to be used in low and medium voltage cable accessories and as such electrical performance must be proven as part of the assembly. Examples of this are described in EN50393, HD 629 and IEC 60502.

Thermal solar systems and components - Custom built systems - Part 2: Test methods for solar water heaters and combisystems

This European Standard applies to small and large custom built solar heating systems with liquid heat transfer medium for residential buildings and similar applications, and gives test methods for verification of the requirements specified in EN 12977-1. This document also includes a method for thermal performance characterization and system performance prediction of small custom built systems by means of component testing and system simulation. Furthermore, this document contains methods for thermal performance characterization and system performance prediction of large custom built systems. This document applies to the following types of small custom built solar heating systems: - systems for domestic hot water preparation only; - systems for space heating only; - systems for domestic hot water preparation and space heating; - others (e.g. including cooling). This document applies to large custom built solar heating systems, primarily to solar preheat systems, with one or more storage vessels, heat exchangers, piping and automatic controls and with collector array(s) with forced circulation of fluid in the collector loop. This document does not apply to - systems with a store medium other than water (e.g. phase- change materials), - thermosiphon systems, - integral collector-storage (ICS) systems.

Thermal solar systems and components - Custom built systems - Part 3: Performance test methods for solar water heater stores

This European Standard specifies test methods for the performance characterization of stores which are intended for use in small custom built systems as specified in EN 12977-1. Stores tested according to this document are commonly used in solar hot water systems. However, the thermal performance of all other thermal stores with water as a storage medium can also be assessed according to the test methods specified in this document. The document applies to stores with a nominal volume between 50 l and 3 000 l. This document does not apply to combistores. Performance test methods for solar combistores are specified in EN 12977-4.

Thermal solar systems and components - Custom built systems - Part 5: Performance test methods for control equipment

This European Standard specifies performance test methods for control equipment. Furthermore, this document contains requirements on accuracy, durability and reliability of control equipment. The tests described in this document are limited to electrically activated components delivered with or for the system by the final supplier. For the purposes of this document controller and control equipment for solar heating systems and auxiliary heaters, if part of the system, are restricted to the following: a) Controllers as: 1) system clocks, timers and counters; 2) differential thermostats; 3) multi-function controllers. b) Sensors as: 1) temperature sensors; 2) irradiance sensors (for short wave radiation); 3) pressure sensors; 4) level sensors; 5) flow meters; 6) heat meters. c) Actuators as: 1) pumps; 2) solenoid and motor valves; 3) relays. d) Combinations of controllers, sensors and actuators listed above. An additional objective of the procedures described in this document is to verify control algorithms and, together with the accuracy of sensors, to determine control parameters. In addition to verifying the functioning of a controller, its equipment and actuators, the determined parameters may be used for numerical system simulations. Typically, electrical anodes are not part of the control equipment and are not controlled by the control equipment. However, because they are electrical appliances, electrical anodes are included in this document.

Air conditioners, liquid chilling packages and heat pumps, with electrically driven compressors, for space heating and cooling - Testing and rating at part load conditions and calculation of seasonal performance

This European Standard covers air conditioners, heat pumps and liquid chilling packages. It applies to factory made units defined in EN 14511-1:2011, except single duct, control cabinet and close control units. This European Standard gives the calculation methods for the determination of reference seasonal energy efficiency SEER and SEERon and reference seasonal coefficient of performance SCOP, SCOPon and SCOPnet. Such calculation methods may be based on calculated or measured values. In case of measured values, this European Standard covers the test methods for determination of capacities, EER and COP values during active mode at part load conditions. It also covers test methods for electric power consumption during thermostat off mode, standby mode and crankcase heater mode. This European Standard serves as an input for the calculation of the system energy efficiency in heating mode of specific heat pump systems in buildings, as stipulated in the standard EN 15316-4-2.

Salt mist corrosion testing of photovoltaic (PV) modules

Photovoltaic (PV) modules are electrical devices intended for continuous outdoor exposure during their lifetime. Highly corrosive wet atmospheres, such as marine environments, could eventually degrade some of the PV module components (corrosion of metallic parts, deterioration of the properties of some non-metallic materials - such as protective coatings and plastics - by assimilation of salts, etc.) causing permanent damages that could impair their functioning. Temporary corrosive atmospheres are also present in places where salt is used in winter periods to melt ice formations on streets and roads. This Standard describes test sequences useful to determine the resistance of different PV modules to corrosion from salt mist containing Cl⁻ (NaCl, MgCl₂, etc.). All tests included in the sequences, except the bypass diode functionality test, are fully described in IEC 61215, IEC 61646, IEC 62108, IEC 61730-2 and IEC 60068-2-52. They are combined in this Standard to provide means to evaluate possible faults caused in PV modules when operating under wet atmospheres having high concentration of dissolved salt (NaCl). Depending on the specific nature of the surrounding atmosphere to which the module is exposed in real operation several testing severities can be applied, as defined in IEC 60068-2-52. For example severity (1) is intended to be used for PV modules used in a marine environment, or in close proximity to the sea. Severities (3) to (6) are intended for PV modules operating in locations where there could be a change between salt-laden and dry atmospheres, for examples in places where salt is used to melt ice formations. Severity (2) is not suitable for PV modules as testing conditions are too weak (this severity is originally intended for products exposed to corrosive environments from time to time that are normally protected by an enclosure) and should be avoided when applying this Standard. This Standard can be applied to both flat plate PV modules and concentrator PV modules and assemblies.

Test procedure of islanding prevention measures for utility-interconnected photovoltaic inverters

The purpose of this International Standard is to provide a test procedure to evaluate the performance of islanding prevention measures used with utility-interconnected PV systems. This standard describes a guideline for testing the performance of automatic islanding prevention measures installed in or with single or multi-phase utility interactive PV inverters connected to the utility grid. The test procedure and criteria described are minimum requirements that will allow repeatability. Additional requirements or more stringent criteria may be specified if demonstrable risk can be shown. Inverters and other devices meeting the requirements of this standard are considered non-islanding as defined in IEC 61727. This standard may be applied to other types of utility-interconnected systems (e.g. inverterbased microturbine and fuel cells, induction and synchronous machines). However, technical review may be necessary for other than inverter-based PV systems.

Solar energy - Solar thermal collectors - Test methods (ISO/DIS 9806:2012)

This International Standard specifies test methods for validating the durability, reliability and safety requirements for fluid heating collectors as specified in EN 12975-1. This International Standard also includes four test methods for the thermal performance characterization of fluid heating collectors. These are steadystate and quasi-dynamic thermal performance of glazed and unglazed liquid heating solar collectors and steady-state thermal performance of glazed and unglazed air heating solar collectors. Performance dependency on flow rate is only included for air heating collectors. This International Standard is not applicable to those collectors in which the thermal storage unit is an integral part of the collector to such an extent that the collection process cannot be separated from the storage process for the purpose of making measurements of these two processes. It is also applicable to thermal-electrical hybrid collectors, so called PVT collectors; however it does not cover electrical safety or other specific properties related to the PV part of these collectors. Collectors that are custom built (built in; e.g. roof integrated collectors that do not compose of factory made modules and are assembled directly on the place of installation) cannot be tested in their actual form for durability, reliability and thermal performance according to this International Standard. Specific size requirements are therefore to be followed when testing these collector types and the test is valid only for larger collectors than the tested module.

Raudteelased rakendused. Energiavarustus ja veerevkoosseis. Energiavarustuse (alajaama) ja veerevkoosseisu vahelise koostalituvõime saavutamise kooskõlastatud tehnilised tingimused

This European Standard establishes requirements for the compatibility of rolling stock with infrastructure particularly in relation to: - co-ordination of protection principles between power supply and traction units, especially fault discrimination for short-circuits; - co-ordination of installed power on the line and the power demand of trains; - co-ordination of traction unit regenerative braking and power supply receptivity; - co-ordination of harmonic behaviour. This European Standard deals with the definition and quality requirements of the power supply at the interface between traction units and fixed installations. This European Standard specifies the interface between rolling stock and electrical fixed installations for traction, in respect of the power supply system. The interaction between pantograph and overhead contact line is dealt with in EN 50367. The interaction with the "control-command" subsystem (especially signalling) is not dealt with in this standard. Requirements are given for TSI lines (both high speed and conventional) and classical lines. For classical lines, values, where given, are for the existing European networks. Furthermore the maximum values that are specified are applicable to the foreseen developments of the infrastructure of the Trans European rail networks. The following electric traction systems are within scope: - railways; - guided mass transport systems that are integrated with railways; - material transport systems that are integrated with railways. This European Standard does not apply retrospectively to rolling stock already in service. Information is given on electrification parameters such as to enable train operating companies to confirm, after consultation with the rolling stock manufacturers, that there will be no consequential disturbance on the electrification system.

Electrical insulating materials - Determination of the effects of ionizing radiation - Part 5: Procedures for assessment of ageing in service

This part of IEC 60544 covers ageing assessment methods which can be applied to components based on polymeric materials (e.g. cable insulation and jackets, elastomeric seals, polymeric coatings, gaiters) which are used in environments where they are exposed to radiation. The object of this standard is aimed at providing methods for the assessment of ageing in service. The approaches discussed in the following clauses cover ageing assessment programmes based on condition monitoring (CM), the use of sample deposits in severe environments and sampling of real-time aged components.

Switches for household and similar fixed electrical installations - Part 2-6: Particular requirements - Fireman's switches for exterior and interior signs and luminaires

This part of IEC 60669 is applicable to fireman's switches used for the breaking of the lowvoltage circuits for exterior and interior signs and luminaires e.g. neon signs for a.c. only with a rated voltage not exceeding 440 V and a rated current not exceeding 125 A. NOTE 101 In the following countries, the rated voltage for the signs and luminous-discharge-tube installations is higher than 1 kV but lower than 10 kV and these should be in accordance with EN 50107 series: all CENELEC countries. Replacement of the 6th paragraph and Note 6 by the following paragraph and new notes: Fireman's switches complying with this standard are suitable for use between -25 °C and +70 °C. NOTE 102 Fireman's switches are designed for overvoltage category III and used in environment of pollution degree 2 according to IEC 60664-1. NOTE 103 In the following country installation rules and/or laws may require different protection switching devices in order to comply with the function given in the scope of this standard: IT.

Short-circuit currents - Calculation of effects - Part 1: Definitions and calculation methods

This part of IEC 60865 is applicable to the mechanical and thermal effects of short-circuit currents. It contains procedures for the calculation of - the electromagnetic effect on rigid conductors and flexible conductors, - the thermal effect on bare conductors. For cables and insulated conductors, reference is made, for example, to IEC 60949 and IEC 60986. For the electromagnetic and thermal effects in d.c. auxiliary installations of power plants and substations reference is made to IEC 61660-2. Only a.c. systems are dealt with in this standard. The following points should, in particular, be noted: a) The calculation of short-circuit currents should be based on IEC 60909. For the determination of the greatest possible short-circuit current, additional information from other IEC standards may be referred to, e.g. details about the underlying circuitry of the calculation or details about current-limiting devices, if this leads to a reduction of the mechanical stress. b) Short-circuit duration used in this standard depends on the protection concept and should be considered in that sense. c) These standardized procedures are adjusted to practical requirements and contain simplifications which are conservative. Testing or more detailed methods of calculation or both may be used. d) In Clause 5 of this standard, for arrangements with rigid conductors, only the stresses caused by short-circuit currents are calculated. Furthermore, other stresses can exist, e.g. caused by dead-load, wind, ice, operating forces or earthquakes. The combination of these loads with the short-circuit loading should be part of an agreement and/or be given by standards, e.g. erection-codes. The tensile forces in arrangements with flexible conductors include the effects of deadload. With respect to the combination of other loads the considerations given above are valid. e) The calculated loads are design loads and should be used as exceptional loads without any additional partial safety factor according to installation codes of, for example, IEC 61936-1 [1].

Fluids for electrotechnical applications – Unused mineral insulating oils for transformers and switchgear

Covers specifications and test methods for unused mineral insulating oils. It applies to oil delivered to the agreed point and time of delivery, intended for use in transformers, switchgear and similar electrical equipment in which oil is required as an insulant and for heat transfer. These oils are obtained by distillation and refining of crude petroleum. Oils with and without additives are both within the scope of this standard. This standard is applicable only to unused mineral insulating oils. Reclaimed oils are beyond the scope of this standard. This standard does not apply to mineral oils used as impregnants in cables or capacitors. NOTE Mineral insulating oils complying with the requirements of this standard, of the same class and containing no additives (see 3.4), are considered to be compatible with one another and can be mixed in any proportion. This does not apply to oils containing additives. Where the user wishes to mix such oils, a check is recommended to be made to ensure that the mixture meets the requirements of this standard. Main changes with regard to previous edition include: the three classes of previous edition have been replaced by only two: transformer oil and low temperature switchgear oil, but a new concept, the lowest cold start energizing temperature, has been included; new properties have been added (i.e. charging tendency); values for properties have been revised.

This part of IEC 60079 is applicable to electrical equipment protected by enclosure and surface temperature limitation for use in explosive dust atmospheres. It specifies requirements for design, construction and testing of electrical equipment. This standard supplements and modifies the general requirements of IEC 60079-0. Where a requirement of this standard conflicts with a requirement of IEC 60079-0, the requirement of this standard takes precedence. This standard does not apply to dusts of explosives, which do not require atmospheric oxygen for combustion, or to pyrophoric substances. This standard does not apply to electrical equipment intended for use in underground parts of mines as well as those parts of surface installations of such mines endangered by firedamp and/or combustible dust. This standard does not take account of any risk due to an emission of flammable or toxic gas from the dust.

Electrical insulating materials - Thermal endurance properties - Part 1: Ageing procedures and evaluation of test results

This part of IEC 60216 specifies the general ageing conditions and procedures to be used for deriving thermal endurance characteristics and gives guidance in using the detailed instructions and guidelines in the other parts of the standard. Although originally developed for use with electrical insulating materials and simple combinations of such materials, the procedures are considered to be of more general applicability and are widely used in the assessment of materials not intended for use as electrical insulation. In the application of this standard, it is assumed that a practically linear relationship exists between the logarithm of the time required to cause the predetermined property change and the reciprocal of the corresponding absolute temperature (Arrhenius relationship). For the valid application of the standard, no transition, in particular no first-order transition should occur in the temperature range under study. Throughout the rest of this standard the term "insulating materials" is always taken to mean "insulating materials and simple combinations of such materials".

 Part 55: Solderable polyurethane enamelled round
 copper wire overcoated with polyamide, Class 180**

This part of IEC 60317 specifies the requirements of solderable enamelled round copper winding wire of class 180 with a dual coating. The underlying coating is based on polyurethane resin, which may be modified providing it retains the chemical identity of the original resin and meets all specified wire requirements. The superimposed coating is based on polyamide resin.
 NOTE A modified resin is a resin that has undergone a chemical change, or contains one or more additives to enhance certain performance or application characteristics. The range of nominal conductor diameters covered by this standard is as follows: - Grade 1: 0.020 mm up to and including 1,600 mm; - Grade 2: 0.020 mm up to and including 1,600 mm. The nominal conductor diameters are specified in Clause 4 of IEC 60317-0-1.

**Flexible insulating sleeving - Part 3: Specifications
 for individual types of sleeving - Sheet 214: Heat-
 shrinkable, polyolefin sleeving, not flame retarded,
 thick and medium wall**

This standard gives the requirements for two types of Heat-shrinkable, polyolefin sleeving, , not flame retarded, thick and medium wall with a nominal shrink ratio of 3:1. This sleeving has been found suitable for use at temperatures of up to 100 °C Type A : Medium wall internal diameter up to 200,0 mm typically Type B : Thick wall internal diameter up to 200,0 mm typically These sleeveings are normally supplied in colour black. Since these types of sleeveings cover a significantly large range of sizes and wall thicknesses, Annex A, Tables 5 and 6, in this document provides a guide to the range of sizes available. The actual size shall be agreed between the user and supplier. Materials which conform to this specification meet established levels of performance. However, the selection of a material by a user for a specific application should be based on the actual requirements necessary for adequate performance in that application and not based on this specification alone.

Fire hazard testing - Part 9-1: Surface spread of flame - General guidance

This part of IEC 60695 provides guidance for the assessment of surface spread of flame for electrotechnical products and the materials from which they are formed. It provides: - an explanation of the principles of flame spread for both liquids and solids, - guidance for the selection of test methods, - guidance on the use and interpretation of test results, and - informative references. This basic safety publication is intended for use by technical committees in the preparation of standards in accordance with the principles laid down in IEC Guide 104 and ISO/IEC Guide 51. One of the responsibilities of a technical committee is, wherever applicable, to make use of basic safety publications in the preparation of its publications. The requirements, test methods or test conditions of this basic safety publication will not apply unless specifically referred to or included in the relevant publications.

Low-voltage switchgear and controlgear - Part 5-3: Control circuit devices and switching elements - Requirements for proximity devices with defined behaviour under fault conditions (PDDB)

This document provides additional requirements to those given in IEC 60947-5-2. It addresses the fault performance aspects of proximity devices with a defined behaviour under fault conditions (PDDB). It does not address any other characteristics that can be required for specific applications. This standard does not cover proximity devices with analogue output. For a PDDB used in applications where additional characteristics, dealt with in other standards, are required, it will be necessary to satisfy the requirements of all relevant standards. The use of this standard alone does not demonstrate suitability for the implementation of any specific safety related functionality. In particular, this standard does not provide requirements for the actuation characteristics of a PDDB, or for means to reduce the effects of mutual interference between devices, e.g. coded targets. Therefore these and any other application specific requirements will need to be considered in addition to the requirements of this standard.

Superconductivity - Part 5: Matrix to superconductor volume ratio measurement - Copper to superconductor volume ratio of Cu/Nb-Ti composite superconducting wires

This part of IEC 61788 covers a test method for the determination of copper to superconductor volume ratio of Cu/Nb-Ti composite superconducting wires. This test method and the alternate method in Annex A are intended for use with Cu/Nb-Ti composite superconducting wires with a cross-sectional area of 0,1 [mm²] to 3 [mm²], a diameter of the Nb-Ti filament(s) of 2 [µm] to 200 [µm], and a copper to superconductor volume ratio of 0,5 or more. The Cu/Nb-Ti composite test conductor discussed in this method has a monolithic structure with a round or rectangular cross-section. This test method is carried out by dissolving the copper with nitric acid. Deviations from this test method that are allowed for routine tests and other specific restrictions are given in this standard. Cu/Nb-Ti composite superconducting wires beyond the limits in the cross-sectional area, the filament diameter and the copper to superconductor volume ratio could be measured with this present method with an anticipated reduction of uncertainty. Other, more specialized, specimen test geometries may be more appropriate for conductors beyond the limits and have been omitted from this present standard for simplicity and to retain low uncertainty. The test method given in this standard is expected to apply to other superconducting composite wires after some appropriate modifications.

Superconductivity - Part 12: Matrix to superconductor volume ratio measurement - Copper to non-copper volume ratio of Nb₃Sn composite superconducting wires

This standard describes the test method for determining the copper to non-copper volume ratio of Cu/Nb₃Sn wires. The test method given hereunder is applicable to Nb₃Sn composite superconducting wires with a cross-sectional area of 0,1 [mm²] to 3,0 [mm²] and a copper to non-copper volume ratio of 0,1 or more. It does not make any reference to the filament diameter; however, it is not applicable to those superconducting wires with their filament, Sn, Cu-Sn alloy, barrier material and other non-copper portions dispersed in the copper matrix or those with the stabilizer dispersed. Furthermore, the copper to non-copper volume ratio can be determined on specimens before or after the Nb₃Sn formation heat treatment process. The Cu/Nb₃Sn wire has a monolithic structure with a round or rectangular cross-section. Though uncertainty increases, this method may be applicable to the measurement of the copper to non-copper volume ratio of the Cu/Nb₃Sn wires whose cross-section and copper to non-copper volume ratio fall outside the specified ranges. This test method may be applied to other composite superconducting wires after some appropriate modifications.

Semiconductor devices - Micro-electromechanical devices - Part 13: Bend- and shear- type test methods of measuring adhesive strength for MEMS structures

This part of IEC 62047 specifies the adhesive testing method between micro-sized elements and a substrate using the columnar shape of the specimens. This international standard can be applied to adhesive strength measurement of microstructures, prepared on a substrate, with width and thickness of 1 µm to 1 mm, respectively. Micro-sized elements of MEMS devices are made up of laminated fine pattern films on a substrate, which are fabricated by deposition, plating, and/or coating with photolithography. MEMS devices include a large number of interfaces between dissimilar materials, at which delamination occasionally occurs during fabrication or in operation. Combination of the materials at the junction determines the adhesive strength; moreover, defects and residual stress in the vicinity of the interface, which are changing by processing condition, strongly affect the adhesive strength. This standard specifies the adhesive testing method for micro-sized elements in order to optimally select materials and processing conditions for MEMS devices. This standard does not particularly restrict test piece material, test piece size and performance of the measuring device, since the materials and size of MEMS device components range widely and testing machine for micro-sized materials has not been generalized.

Semiconductor devices - Micro-electromechanical devices - Part 14: Forming limit measuring method of metallic film materials

This part of IEC 62047 describes definitions and procedures for measuring the forming limit of metallic film materials with a thickness range from 0,5 µm to 300 µm. The metallic film materials described herein are typically used in electric components, MEMS and microdevices. When metallic film materials used in MEMS (see 2.1.2 of IEC 62047-1:2005) are fabricated by a forming process such as imprinting, it is necessary to predict the material failure in order to increase the reliability of the components. Through this prediction, the effectiveness of manufacturing MEMS components by a forming process can also be improved, because the period of developing a product can be reduced and manufacturing costs can thus be decreased. This standard presents one of the prediction methods for material failure in imprinting process.

Packaging of components for automatic handling - Part 4: Stick magazines for electronic components encapsulated in packages of different forms

Stick magazines (including end stoppers) are intended to be used for storage of electronic components, for transport from the manufacturer to the customer and for in-house use in the manufacturing plant. They are also used to feed automatic placement machines for surface mounting as well as for through-hole mounting of electronic components.

Mechanical structures for electronic equipment - Tests for IEC 60917 and IEC 60297 - Part 3: Electromagnetic shielding performance tests for cabinets and subracks

This part of IEC 61587 specifies the tests for empty cabinets and subracks concerning electromagnetic shielding performance, in the frequency range of 30 MHz to 2 000 MHz. Stipulated attenuation values are chosen for the definition of the shielding performance level of cabinets and subracks for the IEC 60297 and IEC 60917 series. The shielding performance levels are chosen with respect to the requirements of the typical fields of industrial application. They will support the measures to achieve electromagnetic compatibility but cannot replace the final testing of compliance of the equipped enclosure. The purpose of this standard is to ensure physical integrity and environmental performance of cabinets and subracks, taking into account the need for different levels of performance in different applications. It is intended to give the user a level of confidence in the selection of products to meet his specific needs. This standard in whole or part applies only to the empty enclosures, for example cabinets and subracks according to IEC 60297 and IEC 60917 and does not apply to the enclosures when electronic equipment is installed. This standard was developed in close relationship to IEC 61000-5-7 but with the specific focus on subracks and cabinets and the determination of performance levels at the chosen frequency range.

FprEN 61747-30-1

Identne FprEN 61747-30-1:2012
ja identne IEC 61747-30-1:201X
Tähtaeg 29.06.2012

Liquid crystal display devices - Part 30-1: Measuring methods for liquid crystal display modules - Transmissive type

This part of IEC 61747 is restricted to transmissive liquid crystal display-modules using either segment, passive or active matrix and achromatic or colour type LCDs. Furthermore, the transmissive modes of transmissive LCD modules with backlights ON are comprised in this document. An LCD module in combination with a touch-panel or a front-light-unit is excluded from the scope because measurements are frequently inaccurate. Touch-panels or front-lightunits are removed before measurement. Throughout the main body of this standard, an integrated backlight is assumed to provide the illumination for the measurements. Deviations from this (e.g. segmented displays without integrated backlights) may usually be handled in the same way as display modules with integrated backlight, if an external backlight is provided. However, in the case where one of the two situations should be handled differently, this will be specifically stated.

Fibre optic interconnecting devices and passive components - Connectors for optical fibres and cables - Part 1: Generic specification

This part of IEC 60874 applies to fibre optic connector sets and individual components (i.e. adaptors, plugs, sockets) for all types, sizes and structures of fibres and cables. It includes: - connector set requirements; This part of IEC 60874 is divided into four clauses: - Clauses 1 (Scope), 2 (Normative references) and 3 (Terms and definitions) contain general information pertaining to this generic specification; - Clause 4 (Requirements) contains all the requirements to be met by connectors covered by this specification. This includes requirements for classification, the IEC specification system, documentation, materials, workmanship, quality, performance, identification, and packaging. NOTE 1 Clauses 1 to 4 are applicable generally and refer to all connector standards NOTE 2 This part of IEC 60874 applies also to the connectors covered by the IEC 61753, IEC 61754, and IEC 61755 series. This standard does not cover test and measurement procedures, which are described in the IEC 61300 series.

Maritime navigation and radiocommunication equipment and systems - Class B shipborne equipment of the automatic identification system (AIS) - Part 2: Self-organising time division multiple access (SOTDMA) techniques

This part of International Standard IEC 62287 specifies operational & performance requirements, methods of testing and required test results for Class B "SO" shipborne AIS equipment using Self-organised TDMA (SOTDMA) techniques as described in Recommendation ITU-R M.1371. This Standard takes into account other associated IEC International Standards and existing National Standards, as applicable. The main differences between Class B "CS" (IEC 62287-1) and Class B "SO" units are that the Class B "SO": - covers all 25 kHz channels listed in Recommendation ITU-R M.1084-4; - only uses the internal GNSS, no position sensor input is allowed; - uses VDL Message 17 for correction of the internal GNSS; - has a presentation interface; - has additional reporting intervals, down to 5 s; - has two power settings, with a high level of 5 W; - has the capability to transmit binary messages; - has the capability to transmit the long-range broadcast message. It is applicable for AIS equipment used on craft that are not covered by a mandatory carriage requirement of AIS under SOLAS Chapter V.

Methodology for communication network dependability assessment and assurance

This International Standard describes a generic methodology for dependability assessment and assurance of communication networks from a network life cycle perspective. It presents the network dependability assessment strategies and methodology for analysis of network topology, evaluation of dependability of service paths, and optimization of network configurations to achieve network dependability performance and dependability of service. It also addresses the network dependability assurance strategies and methodology for application of network health check, network outage control, and test case management to enhance and sustain dependability performance in network service operation. This International Standard is applicable to network service providers, network designers and developers, and network maintainers and operators for assurance of network dependability performance and assessment of dependability of service.

Winter and road service area maintenance equipment - Data acquisition and transmission - Part 2: Protocol for data transfer between information supplier and client application server

The function of this Technical Specification is to combine any vehicle equipment with different board computers to any client application server. The communication interface on vehicle is defined by EN 15430-1:2007+A1:2011. The interface between the information supplier server and the client application server is defined as a specific protocol (flow 3), object of the present Technical Specification. This makes interchangeability possible on both sides of the communication without any restriction in the range of communication technology including memory card, WLAN, GPRS or any other communication media.

Identification card systems - European Citizen Card - Part 4: Recommendations for European Citizen Card issuance, operation and use

CEN/TS 15480-4 recommends card issuance and operational procedures including citizens' registration. CEN/TS 15480-4 gives recommendations with regard to the end-user e.g. with respect to privacy and accessibility aspects. CEN/TS 15480-4 also identifies a set of standard ECC card profiles (e.g. National ID Card, Health Card, Card issued by a Municipality), that can be used as basis for the specification of new ECC projects. For each profile, this Technical Specification uses a specified template which - selects a subset of technical requirements from CEN/TS 15480-1, CEN/TS 15480-2:2011 and CEN/TS 15480-3:2010. - considers the operation of the ECC in its particular environment. The target audience of CEN/TS 15480-4 is the card issuer.

Information technology - Generic cabling systems - Part 99-3: Home cabling infrastructures up to 50 m in length to support simultaneous and non simultaneous provision of applications

This Technical Report describes a grading system applicable to telecommunications cabling within homes which provides a range of implementation solutions to support both non-simultaneous and simultaneous provision of applications incorporating: a) a cabling structure in accordance with, but less complex than that of, EN 50173-4 and with defined connecting hardware pin assignment for certain applications; b) components meeting or exceeding the requirements of EN 50173-4; c) shorter cabling channels than those specified in EN 50173-4. Safety (electrical safety and protection, optical power, fire, etc.) and electromagnetic compatibility (EMC) requirements are outside the scope of this Technical Report and are covered by standards and regulations. However information given in this Technical Report may be of assistance in meeting these standards and regulations.

Industrial communication networks - High availability automation networks - Part 4: Cross-network Redundancy Protocol (CRP)

The IEC 62439 series is applicable to high-availability automation networks based on the ISO/IEC 8802-3 (IEEE 802.3) (Ethernet) technology. This part of the IEC 62439 series specifies a redundancy protocol that is based on the duplication of the network, the redundancy protocol being executed within the end nodes, as opposed to a redundancy protocol built in the switches. The switchover decision is taken in each node individually. The cross-network connection capability enables single attached end nodes to be connected on either of the two networks.

Geographic information - Spatial referencing by coordinates - Part 2: Extension for parametric values (ISO 19111-2:2009)

This part of ISO 19111 specifies the conceptual schema for the description of spatial referencing using parametric values or functions. It applies the schema of ISO 19111 to combine a position referenced by coordinates with a parametric value to form a spatio-parametric coordinate reference system (CRS). The spatio-parametric CRS can optionally be extended to include time. The intended users of this part of ISO 19111 are producers and users of environmental information. Parameters which are attributes of spatial locations or features, but which are not involved in their spatial referencing, are not addressed by this part of ISO 19111.

Geographic information - Filter encoding (ISO 19143:2010)

This International Standard describes an XML and KVP encoding of a system neutral syntax for expressing projections, selection and sorting clauses collectively called a query expression. These components are modular and intended to be used together or individually by other standards which reference this International Standard. EXAMPLE 1 ISO 19142 makes use of some or all of these components. This International Standard defines an abstract component, named AbstractQueryExpression, from which other specifications can subclass concrete query elements to implement query operations. This International Standard also defines an additional abstract query component, named AbstractAdhocQueryExpresison, which is derived from AbstractQueryExpression and from which other specifications can subclass concrete query elements which follow the following query pattern: An abstract query element from which service specifications can subclass a concrete query element that implements a query operation that allows a client to specify a list of resource types, an optional projection clause, an optional selection clause, and an optional sorting clause to query a subset of resources that satisfy the selection clause. This pattern is referred to as an ad hoc query pattern since the server is not aware of the query until it is submitted for processing. This is in contrast to a stored query expression, which is stored and can be invoked by name or identifier. This International Standard also describes an XML and KVP encoding of a system-neutral representation of a select clause. The XML representation is easily validated, parsed and transformed into a server-specific language required to retrieve or modify object instances stored in some persistent object store.

Open Data Communication in Building Automation, Controls and Building Management - Home and Building Electronic Systems - Part 2: KNXnet/IP Communication

This specification defines the integration of KNX protocol implementations on top of Internet Protocol (IP) networks, called KNXnet/IP. It describes a standard protocol for KNX devices connected to an IP network, called KNXnet/IP devices. The IP network acts as a fast (compared to KNX transmission speed) backbone in KNX installations. - Widespread deployment of data networks using the Internet Protocol (IP) presents an opportunity to expand building control communication beyond the local KNX control bus providing: - Remote configuration; - Remote operation (including control and annunciation); - Fast interface from LAN to KNX and vice versa; - WAN connection between KNX systems (where an installed KNX system is at least one line). - A KNXnet/IP system contains at least these elements: - one EIB line with up to 64 (255) EIB devices; OR one KNX segment (KNX-TP1, KNX-TP0, KNX-RF, KNX-PL110, KNX-PL132); - a KNX-to-IP network connection device (called KNXnet/IP server); and typically additional - software for remote functions residing on e.g. a workstation (may be data base application, BACnet Building Management System, browser, ...).

Health informatics - Personal health device communication - Part 10420: Device specialization - Body composition analyzer (ISO/FDIS 11073-10420:2012)

Within the context of the ISO/IEEE 11073 family of standards for device communication, this standard establishes a normative definition of the communication between personal body composition analyzing devices and managers (e.g. cell phones, personal computers, personal health appliances, set top boxes) in a manner that enables plug-and-play interoperability. It leverages appropriate portions of existing standards including ISO/IEEE 11073 terminology and IEEE Std 11073-20601™-20081 information models. It specifies the use of specific term codes, formats, and behaviors in telehealth environments restricting optionality in base frameworks in favor of interoperability. This standard defines a common core of communication functionality for personal telehealth body composition analyzer devices. In this context, body composition analyzer devices are being used broadly to cover body composition analyzer devices that measure body impedances, and compute the various body components including body fat from the impedance.

Health informatics - Personal health device communication - Part 10421: Device specialization - Peak expiratory flow monitor (peak flow) (ISO/FDIS 11073-10421:2012)

The scope of this standard is to establish a normative definition of communication between personal telehealth peak flow monitoring devices (agents) and managers (e.g., cell phones, personal computers, personal health appliances, and set top boxes) in a manner that enables plug-and-play interoperability. It leverages work done in other ISO/IEEE 11073 standards including existing terminology, information profiles, application profile standards, and transport standards. It specifies the use of specific term codes, formats, and behaviors in telehealth environments restricting optionality in base frameworks in favor of interoperability. This standard defines a common core of functionality of a peak-flow monitoring device. The use case is restricted to personal respiratory monitoring and therefore does not include hospital-based spirometry. Continuous and high-acuity monitoring (e.g., for emergency response) are outside the scope of the use case.

**Infotehnoloogia. Juhtmete paigaldamine. Osa 3:
Väljaspool hooneid asuvate süsteemide
planeerimine ja paigaldamine**

This European Standard specifies requirements and provides recommendations for the following aspects of information technology cabling: a) planning; b) installation practice. This European Standard is applicable to all types of information technology cabling outside buildings including generic cabling systems designed in accordance with EN 50173 series. The requirements and recommendations of this European Standard may be applied to cabling that is defined as part of the building. The requirements and recommendations of Clauses 4, 5 and 6 of this European Standard are subject to any site-specific requirements and recommendations of Clause 7. The planning of the pathway systems, spaces and structures within the core and access network cabling as described in Figure 2 is excluded (unless they are the property of the premises owner between the PEF and the buildings within the premises) except for requirements and recommendations that provide basic safety, function and environmental objectives for mechanical, ingress and climatic characteristics (i.e. excluding pathway dimensions, distribution of spaces and similar constraints based on specific transmission methods). The installation practices applicable to all cabling installation methods are included by the provision of the necessary planning requirements and recommendations associated with each one with the exception of information technology cabling installed: - around or within aerial power supply or associated earth conductors; - on infrastructures carrying power supplies in excess of AC/DC 25 kV.

**Electronic health record-system functional model
(ISO/DIS 10781:2012)**

This conformance clause defines the minimum requirements for functional profiles claiming conformance to the EHR System Functional Model. It also identifies how EHR systems achieve conformance to the Functional Model, which is via the system's conformance to a particular functional domain profile, multiple functional profiles, or combination of domain and companion profiles. This clause specifies: - The purpose, structure, and use of conformance criteria that are to be included in the Functional Model and conforming functional profiles, - The rules for defining conforming functional profiles of the Functional Model, - The relationship between functional profiles and EHR systems, - Sample conformance clauses and use case scenarios, - Guidance on the conformance requirements that a functional profile might levy on EHR systems, - Guidance on the purpose and use of an EHR system Conformance Statement. While the conformance requirements for functional profiles can be found in this clause, they necessarily reference the Functional Model and other sources. This conformance clause does not specify testing or validation procedures to assess a functional profile's conformance to the Functional Model. It also does not specify testing or validation procedures to determine whether an EHR system conforms to a functional profile or matches its Conformance Statement.

**Geographic information - Reference model - Part 1:
Fundamentals (ISO/DIS 19101-1:2012)**

This International Standard defines the reference model for standardization in the field of geographic information. This reference model describes the notion of interoperability and sets forth the fundamentals by which this standardization takes place. The description of the reference model is supported by a conceptual framework. The conceptual framework is a mechanism to structure the scope of the standardization activity in geographic information according to the interoperability description. It identifies the various facets of standardization and the relationships that exist between them. This reference model settles the role of semantics, how the new technologies such as the Web and many emerging ways of accessing it, and how the Semantic Web can support interoperability in the field of geographic information. It also provides an umbrella under which additional specific reference models on particular facets of geographic information standardization would be required. Although structured in the context of information technology and information technology standards, this International Standard is independent of any application development method or technology implementation approach.

Tarkvaratehnika. Tarkvaratoote kvaliteedinõuded ja kvaliteedi hindamine (SQuaRE). Sarja SQuaRE teejuht

See standard annab juhiseid tarkvaratoote kvaliteedinõuete ja kvaliteedi hindamise uue standardisarja (SQuaRE) kasutamiseks. Selle teejuhi eesmärk on anda üldine ülevaade sarja SQuaRE sisust, ühistest etalonmudelitest ja määratlustest ning ka seostest dokumentide vahel, võimaldades kasutajail vastavalt nende kasutuseesmärkidele saada head ettekujutust sellest standardisarjast. Selles dokumendis seletatakse ülemineku protsessi vanadelt sarjadelt ISO/IEC 9126 ja 14598 sarjale SQuaRE ning antakse ka teavet selle kohta, kuidas kasutada sarju ISO/IEC 9126 ja 14598 nende senisel kujul.

Standardisari SQuaRE on mõeldud, kuid mitte ainult, tarkvaratoodete väljatöötajatele, hankijaile ja sõltumatuile hindajaile, eriti neile, kes vastutavad tarkvara kvaliteedinõuete spetsifitseerimise ja tarkvaratoodete hindamise eest. Sarja SQuaRE ning ka standardisarjade ISO/IEC 14598 ja 9126 kasutajail on soovitatav kasutada ka käesolevat standardit juhisenähtena oma ülesannete täitmisel.

Gas cylinders - High pressure cylinders for the on-board storage of natural gas as a fuel for automotive vehicles (ISO/DIS 11439:2012)

This International Standard specifies minimum requirements for serially produced light-weight refillable gas cylinders intended only for the on-board storage of high pressure compressed natural gas as a fuel for automotive vehicles to which the cylinders are to be fixed. The service conditions do not cover external loadings that can arise from vehicle collisions, etc. This International Standard covers cylinders of any steel, aluminium or non-metallic material construction, using any design or method of manufacture suitable for the specified service conditions. This International Standard does not cover cylinders of stainless steel or of welded construction. Although this standard uses 200 bar as a reference working pressure, other working pressures can be used. Cylinders covered by this International Standard are designated Type 1, Type 2, Type 3 and Type 4.

Raudteelased rakendused. Energiavarustus ja veerevkoosseis. Energiavarustuse (alajaama) ja veerevkoosseisu vahelise koostalitusvõime saavutamise kooskõlastatud tehnilised tingimused

This European Standard establishes requirements for the compatibility of rolling stock with infrastructure particularly in relation to: - co-ordination of protection principles between power supply and traction units, especially fault discrimination for short-circuits; - co-ordination of installed power on the line and the power demand of trains; - co-ordination of traction unit regenerative braking and power supply receptivity; - co-ordination of harmonic behaviour. This European Standard deals with the definition and quality requirements of the power supply at the interface between traction units and fixed installations. This European Standard specifies the interface between rolling stock and electrical fixed installations for traction, in respect of the power supply system. The interaction between pantograph and overhead contact line is dealt with in EN 50367. The interaction with the "control-command" subsystem (especially signalling) is not dealt with in this standard. Requirements are given for TSI lines (both high speed and conventional) and classical lines. For classical lines, values, where given, are for the existing European networks. Furthermore the maximum values that are specified are applicable to the foreseen developments of the infrastructure of the Trans European rail networks. The following electric traction systems are within scope: - railways; - guided mass transport systems that are integrated with railways; - material transport systems that are integrated with railways. This European Standard does not apply retrospectively to rolling stock already in service. Information is given on electrification parameters such as to enable train operating companies to confirm, after consultation with the rolling stock manufacturers, that there will be no consequential disturbance on the electrification system.

Tähtaeg 29.06.2012

Raudteelased rakendused. Liinikategooriad veeremi ja infrastruktuuri piirkormuste vahelise ühilduvuse määramiseks

Käesolevas Euroopa standardis on kirjeldatud olemasolevate raudteeliinide ja raudteeveeremi liigitusmeetodeid. Standardis on kindlaks määratud tehnilised nõuded veeremi ja infrastruktuuri omaduste ühilduvuse tagamiseks. Standard sobib ühilduvuse tagamiseks kaubaveo-, reisijateveo- ja segaveoliinidel ning sisaldab nõudeid seoses: - raudtee infrastruktuuri vertikaalkandevõime liigitamisega; - raudteeveeremi konstruktsiooniga; - kaubavagunite suurima lubatud kasuliku koormuse kindlakstegemisega. Infrastruktuuri ja veeremi liigitamise kokkuvõtte on antud lisas B. Rööbastee teerajatiste, pealisehitiste ja muldkehade vertikaalkandevõime hindamine lisas A kindlaksmääratud koormusmudelite kasutamise võimaldab liigitada infrastruktuuri liinikategooriatesse. Käesolevas Euroopa standardis on kirjeldatud veeremi ja raudteeliinide infrastruktuuri ühilduvuse kindlakstegemist tavaliste talitusolude korral vertikaalkoormusmõjudega seotud täiendavate kontrollimisteta. Standardis kirjeldatud meetodika ei ole kasutatav kiirraudteeliinide suhtes. Standardi käsitusallas ei kuulu ka kallutuva kerega veerem ning rööbasmasinad ja rööbaskraanad. Standardis ei ole käsitletud Suurbritannias kasutatavat kõikide liinide ja raudteeveeremi liigitamiseks kasutatavat RA-süsteemi (Route Availability System). RA-süsteemile vastava liigituse ja käesolevale standardile vastavate liinikategooriate vastavus on antud lisas C. Standardis ei ole käsitletud rongi suurima kogumassiga ega rongi suurima pikkusega seotud nõudeid. Standardis sätestatud nõuded ei asenda suurimaid lubatud ratta/rööpa dünaamilisi kontaktjõude, veeremi sõiduomadusi, veeremi konstruktsiooniga seotud piiranguid jms käsitlevaid eeskirju.

This European Standard offers a set of rules that are applied in the design and manufacture of electrical installations and equipment to be used on rolling stock to protect the persons from electric shocks. The methods used to satisfy the rules may differ, in accordance with the procedures and practices of the operating organization. This European Standard is applicable to rolling stock of rail transport systems, road transport systems, if they are powered by an external supply (e.g. trolley buses), magnetic levitated transport systems and to the electrical equipment installed in these systems. This European Standard does not apply to - mine railways in underground mines, - crane installations, moving platforms and similar transport systems on rails, - funicular railways, - temporary constructions. - Testing against the requirements of this European Standard is not included. For this, refer to EN 50215.

Railway applications - Rolling stock - Rules for installation of cabling

This European Standard specifies requirements for the installation of cabling on railway vehicles and within electrical enclosures on railway vehicles, including magnetic levitation trains and trolley buses. NOTE With respect to trolley buses, this European Standard applies to the whole electric traction system, including current collecting circuits, power converters and the respective control circuits. The installation of other circuits is covered by street vehicle standards for example those for combustion driven buses. This European Standard covers cabling for making electrical connections between items of electrical equipment, including cables, busbars, terminals and plug/socket devices. It does not cover special effect conductors like fibre optic cables or hollow conductors (waveguides). The material selection criteria given here are applicable to cables with a copper conductor. This European Standard is not applicable to the following: - special purpose vehicles, such as track-laying machines, ballast cleaners and personnel carriers; - vehicles used for entertainment on fairgrounds; - vehicles used in mining; - electric cars; - funicular railways. As the field of cabling in rolling stock is also dealt with in the cable makers' standard, references are made to EN 50264 series, EN 50306 series, EN 50382 series and EN 50355. This European Standard applies in conjunction with the relevant product and installation standards. Stricter requirements than those given in this European Standard may be necessary.

Cranes - General Design - Part 3-1: Limit States and proof competence of steel structure

This European Standard is to be used together with EN 13001-1 and EN 13001-2 and as such they specify general conditions, requirements and methods to prevent mechanical hazards of cranes by design and theoretical verification. NOTE Specific requirements for particular types of cranes are given in the appropriate European Standard for the particular crane type. The following is a list of significant hazardous situations and hazardous events that could result in risks to persons during intended use and reasonably foreseeable misuse. Clauses 4 to 8 of this standard are necessary to reduce or eliminate risks associated with the following hazards: a) exceeding the limits of strength (yield, ultimate, fatigue); b) exceeding temperature limits of material or components; c) elastic instability of the crane or its parts (buckling, bulging). This European Standard is not applicable to cranes which are manufactured before the date of its publication as EN and serves as reference base for the European Standards for particular crane types (see Annex I). NOTE EN 13001-3-1 deals only with the limit state method in accordance with EN 13001-1.

Konveierilindid. Süttivuskatsed tulesimulatsiooniga. Osa 1: Katsed propaanipõletiga

This part of EN 12881 describes three methods for measuring the propagation of a flame along a conveyor belt which has been exposed to a relatively high localised heat source such as a fire. The damage suffered by the conveyor belt, as well as its tendency to support combustion, is measured by observing the extent to which the fire spreads along the test piece. Method A uses a test piece 2 m in length and consumes propane gas through the burner at the rate of $(1,30 \pm 0,05)$ kg per 10 min. Method B uses a test piece 1,5 m in length and consumes propane gas through the burner at the rate of (565 ± 10) g per 50 min. Method C uses a test piece 1,2 m in length and consumes propane gas through the burner at the rate of 150 l per hour (D1) or 190 l per hour (D2).

Electrostatics - Part 4-4: Standard test methods for specific applications - Electrostatic classification of flexible intermediate bulk containers (FIBC)

This part of IEC 61340 specifies requirements for flexible intermediate bulk containers (FIBC) between 0,25 m³ and 3 m³ in volume, intended for use in hazardous explosive atmospheres. The explosive atmosphere may be created by the contents in the FIBC or may exist outside the FIBC. The requirements include: - classification and labelling of FIBC; - classification of inner liners; - specification of test methods for each type of FIBC and inner liner; - design and performance requirements for FIBC and inner liners; - safe use of FIBC (including those with inner liners) within different zones defined for explosion endangered environments, described for areas where combustible dusts are, or may be, present (IEC 60079-10-2), and for explosive gas atmospheres (IEC 60079-10-1); - procedures for type qualification and certification of FIBC, including the safe use of inner liners.

Electrostatics Part 4-4: Standard test methods for specific applications – Electrostatic classification of flexible intermediate bulk containers (FIBC)

Describes procedures for evaluating the ignition risk presented by electrostatic discharges from FIBC to flammable or explosive environments. The requirements of this standard are applicable to all types of FIBC, tested as manufactured, prior to usage, intended for use without liners in flammable or explosive environments with minimum ignition energy of more than 0,14 mJ, and where the charging currents do not exceed 3,0 A. NOTE 0,14 mJ is the minimum ignition energy normally quoted for methanol.

Tekstiil. Hooldustähistuse süsteem (ISO 3758:2012)

This International Standard establishes a system of graphic symbols, intended for use in the marking of textile articles, and for providing information on the most severe treatment that does not cause irreversible damage to the article during the textile care process, and specifies the use of these symbols in care labelling. The following domestic treatments are covered: washing, bleaching, drying and ironing. Professional textile care treatments in dry and wet cleaning, but excluding industrial laundering, are also covered. However, it is recognized that information imparted by the domestic symbols will also be of assistance to the professional cleaner and launderer. NOTE Symbols for industrial laundering can be found in ISO 30023. This International Standard applies to all textile articles in the form in which they are supplied to the end user.

This European Standard deals with the special technical safety requirements for liquid pumps and pump units operating with agrifood-stuff. This European Standard is intended to be used with EN 809 to give the additional requirements for hazards arising from the pumping of substances intended for human and domestic animal consumption (see Clause 4). This European Standard also establishes requirements and/or measures for the reduction of risks during use, including misuse foreseeable by the manufacturer. This European Standard is not intended to be used for pumps and pump units at any stage in the public water supply, nor for pumps handling pharmaceutical products, nor for any other application for which more appropriate standards exist. The pumps and pump units covered by this European Standard are the following: - rotodynamic pumps; - rotary positive displacement pumps; - reciprocating positive displacement pumps. Pumps dealing with agrifood-stuff which are not indicated in this scope are potentially covered by EN 1672-2:2005+A1:2009. This document is not applicable to liquid pumps for agrifoodstuff applications which are manufactured before the date of its publication as an EN.

Food processing machinery - Basic concepts - Part 1: Safety requirements

This European Standard deals with the significant hazards, hazardous situations and events relevant to commercial and industrial food processing machines as defined in Clause 3 when they are used as intended and under conditions of misuse which are reasonably foreseeable by the manufacturer (see Clause 4). This document deals with the significant hazards, hazardous situations and events that occur during transport, assembly and installation, commissioning, setting, teaching, programming, process changeover, operation, cleaning, fault finding and maintenance. This European Standard deals with those risks which occur commonly at food processing machines and for which common technical requirements can be set which can be applied at all (or most) machines which have that particular hazard. This standard is not applicable to the following machines: - food processing machines intended for domestic use; - food processing machines covered by the machine specific standards listed in Annex C; - packaging machines; - machines used in the agricultural and animal rearing sectors. This standard does not deal with the hygiene risks to the consumer of the food product handled in the food processing machine. These risks are dealt with in EN 1672-2. This document is not applicable to food processing machines that were manufactured before the date of its publication as a European Standard.

This document deals with all significant hazards, hazardous situations and events relevant to machines, appliances and machinery, when they are used as intended and under the conditions foreseen by the manufacturer and also the reasonable foreseeable misuse (see Clause 4). These significant hazards, hazardous situations and events exist during the whole life of filling machines. This document is not applicable to filling machines and auxiliary machines which are manufactured before the date of publication of this document by CEN. Filling machines described in this document are no forming, filling and sealing machines as described in EN 415-3. Clipping machines are not covered by this document.

Food processing machinery - Forming machines - Safety and hygiene requirements

This document applies to forming machines, used for forming food products with a mould into portions, as defined in Clause 3. This document applies to both machines standing on the floor and table top machines, and also to machines integrated in a processing line (i.e. interfaces, when the machine is combined with other machines). This European standard deals with the following optional equipment: - paper interleavers; - croquette attachment; - meat ball rollers; - stick inserters; - specific material/product conveyors; - specific lifting and tilting devices. This document deals with all significant hazards, hazardous situations and events relevant to food forming machines, when they are used as intended and under conditions of misuse which are reasonable foreseeable by the manufacturer (see Clause 4). This document deals with the significant hazards, hazardous situations and events during transport, assembly and installation, commissioning and use as defined in EN ISO 12100:2010, Clause 5.4. This document is not applicable to forming machines which are manufactured before the date of publication of this document by CEN.

Durability of reaction to fire performance - Classes of fire-retardant treated wood-based product in interior and exterior end use applications

This European Technical Specification describes the characteristics which fire-retardant treated wood products should exhibit so that their fire-retardant properties persist undiminished throughout the desired service life in the anticipated conditions of use. The Technical Specification prescribes the classification requirements for the durability of the reaction to fire performance of fire-retardant treated wood-based products to be used in interior and exterior end use conditions. The products initially need to meet required reaction to fire classification. For interior and exterior use, limited hygroscopicity needs to be verified. In addition, products for exterior use needs to meet the minimum durability of reaction to fire performance requirements specific to the end use. The requirements are applicable for fire-retardant treated (applied by penetrating and superficial processes or with film forming or intumescent fire-retardant coatings) solid wood and wood-based products and woodbased products in which the fire-retardant is incorporated during manufacture. The fire-retardant treated products may be coated with an ordinary paint. Mechanical properties and biological durability of fire-retardant treated wood products are not covered by this European Technical Specification. Paints, coatings and varnishes intended to improve the reaction to fire performance of a construction product when incorporated in the works, i.e. a building, are covered by ETAG 028 [19]. This Technical Specification may be used as a basis for an approval system.

Mootorikütused. Vedelgaas. Nõuded ja katsemeetodid KONSOLIDEERITUD TEKST

This European Standard specifies requirements and test methods for marketed and delivered automotive LPG (Liquefied Petroleum Gas). It is applicable to automotive LPG for use in LPG engine vehicles designed to run on automotive LPG. NOTE: For the purposes of this European Standard, the term "% (V/V)" is used to represent the volume fraction. WARNING - Attention is drawn to the risk of fire and explosion when handling LPG and to the hazard to health which arises through inhalation of excessive amounts of LPG. LPG is a highly volatile hydrocarbon liquid which is normally stored under pressure. If the pressure is released large volumes of gas will be produced which form flammable mixtures with air over the range of approximately 2 % (V/V) to 10 % (V/V). This European Standard involves the sampling, handling and testing of LPG. All procedures should be conducted away from sources of ignition such as naked flames, unprotected electrical equipment and electrostatic hazards. Testing should be performed as far as practicable under an electrically-safe ventilation hood. LPG in liquid form can cause cold burns to the skin. Protective clothing such as gloves and goggles should be worn if contact with the skin is likely to occur. Unnecessary inhalation of LPG vapour should be avoided. The operator should not be exposed to atmospheres containing more than 1 800 mg/m³ over an 8 h time-weighted average (TWA) reference period, or more than 2 250 mg/m³ over a short term, 10 min reference period. One of the tests described in this European Standard involves the operator inhaling a mixture of air and LPG vapour. Particular attention is drawn to the cautionary statement provided in A.1, where this method is referred to.

Specification for the performance of automatic tank contents gauges

This European Standard specifies the minimum performance requirements for various classes of automatic tank gauges which are limited to static tanks of shop fabricated manufacture both metallic and non metallic, underground and above ground which do not exceed 5 m in height. It is applicable to gauges for fuels (products) which are flammable, having a flash point up to but not exceeding 100 °C, stored at premises (e.g. filling stations) at which fuel is dispensed for use in vehicles and other forms of transportation. This European Standard applies to gauges suitable for use at ambient temperatures and subject to normal operational pressure variations. Gauging of liquefied gases are not covered by this standard. This European Standard relates to the measurement of product level, measurement of product temperature and detection of the presence of free water. The detection of free water may be compromised for Alcohol blended fuels.

Liquefied petroleum gases - Determination of dissolved residue - Gas chromatographic method using liquid, on-column injection

This European Standard specifies a method for the determination of the dissolved residual matter, also known as evaporation residue, in liquefied petroleum gases (LPG), by gas chromatography in the range of (10 to 600) mg/kg (ppm mass). This test method quantifies soluble organic compounds (hydrocarbon materials), sometimes called 'evaporation residue', which can be present in liquefied petroleum gases and which are substantially less volatile than the LPG product, i.e. with a boiling point between 174 °C and 522 °C (C10 to C40). Higher boiling materials, or materials that adhere permanently to the chromatographic column, will not be detected. WARNING - This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

Environmental acceptance requirements for tin whisker susceptibility of tin and tin alloy surface finishes

The methodology described in this document is applicable for environmental acceptance testing of tin based surface finishes and mitigation practices for tin whiskers. This methodology may not be sufficient for applications with special requirements, (i.e. military, aerospace, etc.). Additional requirements may be specified in the appropriate requirements (procurement) documentation. This specification does not apply to components with bottom-only terminations where the full plated surface is wetted during assembly (for example: quad flat no leads and ball grid array components, flip chip bump terminations). Adherence to this standard shall include meeting the reporting requirements described in Clause 6

Lubricated metal-powder mixes - Determination of lubricant content - Soxhlet extraction method (ISO/FDIS 13944:2012)

This International Standard specifies a method for the determination of the lubricant content of a powder mix. The method is also suitable for preparing samples for measuring the content of elements, e.g. graphite and oxygen, the determination of which is interfered with by the presence of a lubricant. A condition of the application of the method is that a suitable solvent for the lubricant concerned is known and available.

Steel and steel products - Location and preparation of samples and test pieces for mechanical testing (ISO/DIS 377:2012)

This International Standard specifies requirements for the identification, location and preparation of samples and test pieces intended for mechanical tests on steel sections, bars, rod, flat products and tubular products as defined in ISO 6929. If agreed in the order this standard may also apply to other metallic products. These samples and test pieces are for use in tests which are carried out in conformity with the methods specified in the product or material standard or, in the absence of this, in the test standard. Where the requirements of the order or product standard differ from those given in this International Standard, then the requirements of the order or product standard apply.

Tähtaeg 29.06.2012

Metallic materials - Instrumented indentation test for hardness and materials parameters - Part 1: Test method (ISO/DIS 14577-1:2012)

This part of ISO 14577 specifies the method of instrumented indentation test for determination of hardness and other materials parameters for the three ranges given in Table 1. The macro and micro ranges are distinguished by the test forces in relation to the indentation depth. Attention is drawn to the fact that the micro range has an upper limit given by the test force (2 N) and a lower limit given by the indentation depth of 0,2 µm. The determination of hardness and other materials parameters is given in Annex A. At high contact pressures, damage to the indenter is possible. For this reason in the macro range, hardmetal indenters are often used. For test pieces with very high hardness and modulus of elasticity permanent indenter deformation may occur and this should be detected using suitable reference materials and its influence on the test result shall be taken into account.

Paints and varnishes - Determination of the overcoatability and recoatability of a coating (ISO/DIS 16927:2012)

This standard specifies a method for testing the recoatability of unaged single-coat or multi-coat systems using a coating material which is intended for repairing damaged areas during or after installation. Since the testing of recoatability may be conducted under different aspects this standard only specifies one procedure and indicates the basic parameters which have to be laid down for testing. In the following, the existing single-coat or multi-coat system is indicated as coating I and the new single-coat or multi-coat system as coating II. The same applies analogously for the respective coating materials.

Particulate air filters for general ventilation - Determination of the filtration performance

This European Standard refers to particulate air filters for general ventilation. These filters are classified according to their performance as measured in this test procedure. This European Standard contains requirements to be met by particulate air filters. It describes testing methods and the test rig for measuring filter performance. In order to obtain results for comparison and classification purposes, particulate air filters shall be tested against two synthetic aerosols, a fine aerosol for measurement of filtration efficiency as a function of particle size within a particle size range 0,2 μm to 3,0 μm , and a coarse one for obtaining information about test dust capacity and, in the case of coarse filters, filtration efficiency with respect to coarse loading dust (arrestance). This European Standard applies to air filters having an initial efficiency of less than 98 % with respect to 0,4 μm particles. Filters shall be tested at an air flow rate between 0,24 m³/s (850 m³/h) and 1,5 m³/s (5400 m³/h). The performance results obtained in accordance with this standard cannot by themselves be quantitatively applied to predict performance in service with regard to efficiency and lifetime. Other factors influencing performance to be taken into account are described in Annex A (informative).

Air conditioners, liquid chilling packages and heat pumps, with electrically driven compressors, for space heating and cooling - Testing and rating at part load conditions and calculation of seasonal performance

This European Standard covers air conditioners, heat pumps and liquid chilling packages. It applies to factory made units defined in EN 14511-1:2011, except single duct, control cabinet and close control units. This European Standard gives the calculation methods for the determination of reference seasonal energy efficiency SEER and SEERon and reference seasonal coefficient of performance SCOP, SCOPon and SCOPnet. Such calculation methods may be based on calculated or measured values. In case of measured values, this European Standard covers the test methods for determination of capacities, EER and COP values during active mode at part load conditions. It also covers test methods for electric power consumption during thermostat off mode, standby mode and crankcase heater mode. This European Standard serves as an input for the calculation of the system energy efficiency in heating mode of specific heat pump systems in buildings, as stipulated in the standard EN 15316-4-2.

Electricity metering equipment - Dependability - Part 32-1: Durability - Testing of the stability of metrological characteristics by applying elevated temperature

The stability of metrological characteristics is one important aspect of durability. This part of IEC 62059 specifies a method for testing the stability of metrological characteristics of electricity meters, by operating a test specimen at the upper limit of the specified operating range of temperature, voltage and current for an extended period. Functional performance other than the accuracy of energy measurement is out of the scope of this standard. Note, that from the results of this test, no conclusion can be drawn for the length of period during which the stability of the metrological characteristics will be maintained when the meter is operated under usual conditions. This International Standard is applicable to all types of electricity meters in the scope of IEC TC 13.

Thermal performance of buildings - Calculation of internal temperatures of a room in summer without mechanical cooling - General criteria and validation procedures (ISO 13791:2012)

This International Standard specifies the assumptions, boundary conditions, equations and validation tests for a calculation procedure, under transient hourly conditions, of the internal temperatures (air and operative) during warm periods, of a single room without any cooling/heating equipment in operation. No specific numerical techniques are imposed by this International Standard. Validation tests are included in Clause 8. An example of a solution technique is given in Annex A. This International Standard does not contain sufficient information for defining a procedure able to determine the internal conditions of special zones such as attached sun spaces, atria, indirect passive solar components (trombe walls, solar panels) and zones in which the solar radiation may pass through the room. For such situations different assumptions and more detailed solution models are needed (see Bibliography).

Bituumen ja bituumensideained. Terminoloogia

This European Standard defines terms for paving grade or industrial bitumen of various types and binders derived from bitumen. This standard is intended to cover materials only within the scope of CEN/TC 336, i.e. only bitumens and bituminous binders. It should consequently not extend to non-petroleum "hydrocarbon" binders such as coal tar and its derivatives or to natural asphalts. However, some definitions are given for some excluded materials and related terms. The corresponding terms were introduced only when they appeared in a definition of a product or process and when their definition was found necessary for understanding or for avoiding any ambiguity.

Lightweight aggregates for concrete, mortar, grout, bituminous mixtures, surface treatments and for unbound and bound applications

This European Standard specifies the properties of lightweight aggregates and fillers derived thereof obtained by processing natural or manufactured materials and mixtures of these aggregates for concrete, mortar and grout, bituminous mixtures and surface treatments and for unbound and hydraulically bound applications for construction works. This European Standard covers lightweight aggregates of mineral origin having particle densities not exceeding 2000 kg/m³ (2,000 Mg/m³) or loose bulk densities not exceeding 1200 kg/m³ (1,200 Mg/m³) including: a) natural lightweight aggregates; b) lightweight aggregates manufactured from natural materials; c) lightweight aggregates manufactured from by-products of industrial processes or from recycled materials; d) lightweight aggregates as by-products of industrial processes. A list of the source materials that have been considered and are within the scope of this standard is given in Annex A (normative). NOTE 1 Recycled aggregates from construction and demolition waste and Municipal Solid Waste Incinerator Bottom Ash (MIBA) are covered by standards EN 12620, EN 13043, EN 13139 and EN 13242. Some lightweight aggregates for specific applications are covered in separate European product standards (Annex B, normative). This standard incorporates a general requirement that aggregates shall not release any dangerous substances in excess of the maximum permitted levels specified in a relevant European Standard for the material or permitted in the national regulations of the member state of destination. NOTE 2 Requirements for the declaration of the potential of aggregates to release regulated dangerous substances are currently under development. Until such time as these are finalised attention should be paid to requirements at the place of use. This standard also specifies that a quality control system is in place for use in factory production control and it provides for the evaluation of conformity of the products to this European Standard. The requirements specified in this standard may not be equally relevant to all types of lightweight aggregates. For particular applications the requirements and tolerances can be adapted for the end use.

Extended application of test results for fire resistance and/or smoke control for door, shutter and openable window assemblies, including their elements of building hardware - Part 5: Fire resistance of hinged and pivoted metal framed glazed doorsets and openable windows

This Part of prEN 15269, which should be read in conjunction with prEN 15269-1, covers single and double leaf, hinged and pivoted metal framed, glazed doorsets or openable windows. This document prescribes the methodology for extending the application of test results obtained from test(s) conducted in accordance with EN 1634-1. Subject to the completion of the appropriate test or tests selected from those identified in Clause 4 the extended application may cover all or some of the following non-exhaustive list: - Integrity only (E), radiation (EW) or insulated (EI1 or EI2) classifications; - Doorsets and openable windows - Door / window leaf; - wall/ceiling fixed elements (frame/suspension system); - glazing and non-glazed panels in doorset and openable window - items of building hardware; - decorative finishes; - intumescent, smoke, draught or acoustic seals; - alternative supporting construction(s).

Geosynthetic clay barriers - Determination of water flux index - Flexible wall permeameter method at constant head

This European Standard describes an index test method that covers laboratory measurement of water flux through saturated geosynthetic clay barrier (GBR-C) specimens using a flexible wall permeameter at constant head. This test method is applicable to GBR-C products with no additional sealing layers attached. This test method provides a measurement of flux under a prescribed set of conditions that can be used for manufacturing quality control. The test method can also be used to check conformance. The flux value determined using this test method is not considered to be representative of the in-service flux of a GBR-C.

Fan assisted radiators, convectors and trench convectors - Part 1: Technical specifications and requirements

This European Standard defines the technical specifications and requirements of fan assisted radiators, convectors and trench convectors for permanent installation in central heating systems. This European Standard covers radiators and convectors fed with water or steam at temperatures below 120 °C, supplied by a remote heating source. This European Standard does not apply to discrete heating appliances. This European Standard also defines the additional common data that the manufacturer shall provide to the trade in order to ensure the correct application of the products. This European Standard applies to the testing of thermal output and cooling capacity of fan assisted radiators, convectors and trench convectors, i.e. - fan assisted radiators and convectors, provided the heater/cooler has a dedicated fan or fans, - trench convectors with and without fan(s), provided the fan(s) are dedicated, - ventilation radiators and convectors (only heating). This European Standard also applies for radiators and convectors according to EN 442-2 to determine their cooling capacity.

Internal blinds - Protection from strangulation hazards - Test methods

This European Standard specifies test methods for the verification of the requirements relating to the protection from strangulation as specified in EN 13120/prA1:2012. It applies to all internal blinds, whatever their design and the nature of the materials used, such as: - venetian blind: free hanging, guided, non-retractable; - roller blind: free hanging, side guided, with tensioned fabric; - vertical blind: free hanging, with top and bottom track, sloping headrail; - pleated and honeycomb blind: free hanging, guided, laterally moving, tensioned; - Roman Shades; - Austrian / Festoon blinds; - panel blinds; - plantation shutters; - roll-up blinds. This European Standard also applies to insect screens as specified in EN 13561 and to blinds in sealed glazed units. These products may be operated manually, with or without compensating springs, or by means of electric motors (power operated products).

Internal blinds - Protection from strangulation hazards - Requirements and Test methods for safety devices

This European Standard specifies requirements and test methods for safety devices to be used for protection from strangulation in internal blinds as specified in EN 13120 and insect screens as specified in EN 13561. These devices might be fitted to internal blinds and insect screens at the time of manufacture or for retrofitting. Safety devices covered include the following: - Tensioning devices; - Breakaway devices; - Accumulation devices; - Non tangling devices; - Inner cord stops. NOTE Although at the time this standard has been published, no product standard exists for draperies, requirements and test methods specified in the present standard might be applied to safety devices used in such products. For clarification purpose, the term "internal blinds" used in the present standard should mean "internal blinds and insect screens".

Acoustics - Field measurement of sound insulation in buildings and of building elements - Part 1: Airborne sound insulation (ISO/DIS 16283-1:2012)

This part of ISO 16283 specifies procedures to determine the airborne sound insulation between two rooms in a building using sound pressure measurements. It is intended for room volumes in the range from 10 to 250 m³ in the frequency range from 50 to 5 000 Hz. The test results can be used to quantify, assess and compare the airborne sound insulation in unfurnished or furnished rooms where the sound field may, or may not approximate to a diffuse field. The measured airborne sound insulation is frequency-dependent and can be converted into a single number to characterise the acoustic performance using the rating procedures in ISO 717-1.

Road restraint systems - Part 8: Motorcycle road restraint systems which reduce the impact severity of motorcyclist collisions with safety barriers

This Technical Specification specifies requirements for the impact performance of systems designed for the reduction of impact severity for PTW riders impacting safety barriers whilst sliding along the ground, having fallen from their PTW vehicle. The protection systems concerned are those fitted to barriers or barriers that have an inherent PTW rider protection or risk reduction capability. This Technical Specification excludes the assessment of the vehicle restraint capabilities of barriers and the risk that they represent to the occupants of impacting cars. The assessment of performance of impacting vehicles is covered by EN 1317-1 and EN 1317-2. This Technical Specification defines performance classes taking into account rider speed classes, impact severity and the working width of the system with respect to rider impacts. For systems designed to be added to a standard barrier, the test results are valid only when the system is fitted to the model of barrier used in the tests since the performance will not necessarily be the same if the system is fitted to a different barrier.

Kodused gaaskuumutusega toiduvalmistusseadmed. Osa 1-2: Ohutus. Võimendatud konvektsiooniga ahjud ja/või grillid

This European Standard specifies the special constructional and operational characteristics, as well as the requirements and methods of test for safety and marking, for domestic cooking appliances having forced convection ovens and /or grills using combustible gases, as defined in EN 30-1-1:2008+A2:2010. Unless specifically excluded, this European Standard applies to appliances or their component parts, whether the component parts are independent or incorporated as part of the appliance, even if the other heating components use electrical energy (for example combined gas-electric cookers). This European Standard includes requirements covering the electrical safety of equipment incorporated in the appliance that are associated with the use of gas. It does not include requirements covering the electric safety of electrically-heated components or their associated equipment¹). This European Standard does not apply to: - outdoor appliances; - appliances connected to a combustion products evacuation duct; - appliances having a pyrolytic gas oven; - appliances having covered burners which do not comply with the constructional requirements of EN 30-1-1:2008+A2:2010, 5.2.8.2.2; - appliances incorporating flame supervision devices and having an automatic ignition device for which the duration of the ignition attempt is limited by design; - appliances equipped with a burner that is periodically ignited and extinguished under the control of an automatic on/off device; - appliances equipped with a burner having a fan for the supply of combustion air or for the evacuation of the products of combustion; - appliances supplied at pressures greater than those defined in EN 30-1-1:2008+A2:2010, 7.1.2; - appliances equipped with an oven and/or with a grill having a fan either for the supply of combustion air or for the evacuation of the products of combustion; - appliances equipped with a compartment in which a burner and an electric heating element can function simultaneously; - appliances having one or more burners that are capable of remote operation (type 1 or type 2), unless the burner(s) concerned are thermostatically controlled oven burners of time-controlled ovens that are designed for a delayed start without the user being present. This European Standard does not cover the requirements relating to third family gas cylinders, their regulators and their connection. This European Standard only covers type testing.

Furniture - Bunk beds and high beds - Part 1: Safety, strength and durability requirements

This European Standard specifies requirements for the safety, strength and durability of bunk beds and high beds for domestic and non-domestic use. The loads and forces in the strength and durability tests apply to beds with an internal length greater than 140 cm and a maximum bed base width of 120 cm. The dimensional requirements are intended to minimise the risk of accidents, particularly to children. The strength and durability requirements are intended to represent use by one occupant per bed. Safety requirements for other products included in a bunk bed/high bed, for example a table or storage furniture, are not included in this standard. This European Standard does not apply to bunk beds and high beds used for special purposes, including but not limited to prison, the military and fire brigades.

This European Standard specifies a method for the assessment of the surface resistance to penetrating scratches. It relates to the rigid surfaces of all finished products, regardless of their material. It does not apply to finishes on leather and fabrics. Method A is suitable for all types of surface coatings and coverings except for melamine faced boards (according to EN 14322) and HPL (according to EN 438-1). It simulates measurable penetrating and/or deforming scratches. Method B is suitable for all types of surfaces. It simulates first visible scratches that may only be a change in the gloss. The test is intended to be carried out on a part of finished furniture. It can however be carried out on test panels of the same material, finished in an identical manner to the finished product, and of a size sufficient to meet the requirements of the test. It is essential that the test be carried out on unused surfaces.

Koduses ja sellega sarnanevas kasutuses elektriseadmed. Katse eeskiri õhu kaudu leviva müra määramiseks. Osa 1: Üldnõuded

This part of IEC 60704 applies to electric appliances (including their accessories or components) for household and similar use, supplied from mains or from batteries. By similar use is understood the use in similar conditions as in households, for example in inns, coffee-houses, tea-rooms, hotels, barber or hairdresser shops, laundrettes, etc., if not otherwise specified in part 2. This standard does not apply to - appliances, equipment or machines designed exclusively for industrial or professional purposes; - appliances which are integrated parts of a building or its installations, such as equipment for air conditioning, heating and ventilating (except household fans, cooker hoods and free standing heating appliances), oil burners for central heating, pumps for water supply and for sewage systems; - separate motors or generators; - appliances for outdoor use.

Open Data Communication in Building Automation, Controls and Building Management - Home and Building Electronic Systems - Part 2: KNXnet/IP Communication

This specification defines the integration of KNX protocol implementations on top of Internet Protocol (IP) networks, called KNXnet/IP. It describes a standard protocol for KNX devices connected to an IP network, called KNXnet/IP devices. The IP network acts as a fast (compared to KNX transmission speed) backbone in KNX installations. - Widespread deployment of data networks using the Internet Protocol (IP) presents an opportunity to expand building control communication beyond the local KNX control bus providing: - Remote configuration; - Remote operation (including control and annunciation); - Fast interface from LAN to KNX and vice versa; - WAN connection between KNX systems (where an installed KNX system is at least one line). - A KNXnet/IP system contains at least these elements: - one EIB line with up to 64 (255) EIB devices; OR one KNX segment (KNX-TP1, KNX-TPO, KNX-RF, KNX-PL110, KNX-PL132); - a KNX-to-IP network connection device (called KNXnet/IP server); and typically additional - software for remote functions residing on e.g. a workstation (may be data base application, BACnet Building Management System, browser, ...).

Mänguasjade ohutus. Osa 3: Teatud elementide migratsioon

This European Standard specifies requirements and test methods for the migration of aluminium, antimony, arsenic, barium, boron, cadmium, chromium (III), chromium (VI), cobalt, copper, lead, manganese, mercury, nickel, selenium, strontium, tin, organic tin compounds and zinc from toy materials and from parts of toys. Packaging materials are not considered to be part of the toy unless they have intended play value. NOTE 1 See guidance document of the European Commission guidance document no. 12 [2] on the application of the directive on the safety of toys – packaging The standard contains requirements for the migration of certain elements from the following categories of toy materials: - Category I : Dry, brittle, powder like or pliable materials; - Category II : Liquid or sticky materials; - Category III : Scraped-off materials. Toys and parts of toys which, due to their accessibility, function, mass, size, or other characteristics, clearly exclude any hazard due to sucking, licking or swallowing or prolonged skin contact, bearing in mind the normal or foreseeable behaviour of children, are not required to be subjected to the requirements of this standard. NOTE 2 For the purposes of this standard, the following criteria are considered appropriate to determine the likelihood of sucking, licking or swallowing toys and their parts and of prolonged skin contact: - All toys intended to be put in the mouth or to the mouth, cosmetics toys and writing instruments categorised as toys may be sucked, licked or swallowed; - All the accessible parts and components of toys intended for children up to 6 years of age may come into contact with the mouth. The likelihood of mouth contact with parts of toys intended for older children is not considered significant in most cases; - In principal, for all toys and accessible parts of toys a prolonged skin contact should be expected (see G.1).

STANDARDITE TÕLKED KOMMENTEERIMISEL

Selles jaotises avaldame teavet eesti keelde tõlgitavate Euroopa või rahvusvaheliste standardite kohta ja inglise keelde tõlgitavate algupärase standardite kohta.

Veebruarikuust 2004 alates ei avaldata teavet arvamusküsitluse jaotises eelpool nimetatud standardite kohta, kuna tegemist on varem jõustumisteate meetodil üle võetud standarditega, mille sisu osas arvamust avaldada ei saa. Alates aastast 2008 ei muuda standardi tõlkimine standardi tähises aastaarvu ning eestikeelse standardi avaldamise aasta on sama, mis standardi esmakordsel avaldamisel Eesti standardina (reeglina jõustumisteate meetodil standardi inglisekeelse teksti kättesaadavaks tegemisega).

Standardite tõlgetega tutvumiseks palume ühendust võtta EVS-i standardiosakonnaga standardiosakond@evs.ee või ostmiseks klienditeenindusega standard@evs.ee.

Tõlgete kommenteerimise ja ettepanekute esitamise perioodi lõpp on 01.06.2012

EVS-EN 60359:2003

Elektrilised ja elektroonilised mõõteseadmed. Talituskarakteristikud

Seda rahvusvahelist standardit saab rakendada järgnevate, esmajoones tööstusotstarbeliste elektriliste ja elektrooniliste mõõteseadmete omaduste iseloomustamiseks: elektriliste suuruste mõõtmiseks ettenähtud näitavad ja salvestavad mõõtevahendid; elektrilisi suurusi hoidvad materiaalmõõdud; mitteelektrilisi suurusi mõõtvad mõõtevahendid, mis kasutavad kõigis mõõteahelates elektrilist põhimõtet ja esitavad väljundis elektrisignaali. Standard kehtib tööstusolude püsitingimustel (vt 3.1.15) kasutatavate mõõteriistade omaduste iseloomustamisel. Standard põhineb mõõtetulemuse määramatuse arvutamise ja

kirjeldamise GUM-is selgitatud meetoditel ning viitab GUM statistilistele protseduuridele, mida kasutatakse etteantud määramatust iseloomustavate intervallide määramiseks (kaasaarvatud mittevähetahtsate määramatuste arvestamise viise jälgitavusahelas). Antud standard ei ole suunatud määramatuse muuks kasutamiseks peale määratletud omadustega mõõteriistade (või mõõteseadmete), mis on läbinud vastavushindamise katsetused. Standardi eesmärgiks on kindlustada antud käsitlusala seadmete ühetaoline tehniliste nõuete ja määramatuse määramise meetod. Kõik teised antud standardi käsitlusalasse kuuluvate eri tüüpi seadmete vajalikud nõuded on esitatud vastavates IEC tootestandardites. Näiteks: metrooloogiliste karakteristikute ja nende ulatuste ning mõjurite ja nendele kehtestatud tööpiirkondade valikud.

Identne: IEC 60359:2001, EN 60359:2002

EVS-EN 71-2:2011

Mänguasjade ohutus. Osa 2: Süttivus

Standardi see osa määrab kindlaks põlevmaterjalide kategooriad, mis on keelatud kõigis mänguasjades ja nõuded, mis puudutavad teatud mänguasjade süttivust, kui nad on allutatud väikese süüteallika toimele. Jaotises 5 kirjeldatud katsemeetodeid kasutatakse mänguasjade süttivuse määramiseks kindlaks määratud katsetingimustes. Saadud katsetulemusi ei saa käsitleda kui andmeid, mis annaksid üldise ülevaate mänguasjade või materjalide potentsiaalsest tuleohtlikkusest, kui neile rakendatakse teistsuguseid süttimisallikaid. Standard sisaldab kõigi mänguasjade kohta kehtivaid üldisi nõudeid ning spetsiifilisi nõudeid ja katsemeetodeid järgmiste mänguasjade kohta, milliseid vaadeldakse suurimat ohtu kujutavatena: - peas kantavad mänguasjad: habemed, vuntsid, parukad jmt, millised valmistatakse juustest, karvadest või muust sarnaste omadustega materjalist; maskid; kapuutsid, peakatted jmt; lendlevad mänguasjade elemendid, mida kantakse peas, kuid mitte paberist üllatusefektid, mis tavaliselt kaasnevad peo paugukonfettidega; - maskeerimiskostüümid ning mängimisel selga panemiseks mõeldud mänguasjad; - lapsele sisenemiseks mõeldud mänguasjad; - pehmed täidetud mänguasjad.

MÄRKUS Täiendavad nõuded elektriliste mänguasjade süttivusele on määratud standardis EN 62115.

Identne: EN 71-2:2011

EVS-EN 71-8:2011

Mänguasjade ohutus. Osa 8:

Tegevusmänguasjad koduseks kasutamiseks

Standard määrab nõuded ja katsemeetodid aktiivse tegevuse mänguasjadele koduseks kasutamiseks, ning millele on tihti liidetud või mis sisaldavad konstruktsioonis risttala, samuti nendega sarnastele mänguasjadele, mis on mõeldud lastele kuni 14. eluaastani nende peal või sees mängimiseks ning mis sageli peavad kandma ühe või enama lapse raskust. See EN 71 osa määrab ka nõuded: - eraldi neile müüdüd tarvikutele ning aktiivse tegevuse mänguasja komponentidele; - eraldi müüdüd kiige komponentidele, mis on valmis kasutamiseks või on kombinatsioonis aktiivse tegevuse mänguasjaga; - ehituskomplektidele aktiivse tegevuse mänguasjana, k.a vastavalt kokkupanekujuhendiga kokkupanekuks ettenähtud aktiivse tegevuse mänguasja komponendid.

Käsitlusalast jäävad välja:

- mänguväljakute seadmed avalikuks kasutamiseks vastavalt standardile EN 1176;
- vibuna paigaldatud kiiged nagu kiikhobused ja sarnased tooted, mis on kaetud erinõuetega vastavalt standardile EN 71-1;
- mängubasseinid maksimaalse vee-sügavusega üle 400 mm, mõõdetuna sügavaima punkti ja ülevooluava vahel;
- mängutrampliinid.

EVS-EN 933-1:2012

Täitematerjalide geomeetriliste omaduste katsetamine. Osa 1: Terastikulise koostise määramine. Sõelumismeetod

See Euroopa standard kirjeldab pesemise ja kuivatamise etalonmeetodit, mida kasutatakse täitematerjali terastikulise koostise määramiseks tüübikatsetel ja erimeelsuste korral. Teistel eesmärkidel, näiteks tehase

tootmisohjel, võib kasutada teisi meetodeid, eeldusel, et rahuldav seos etalonmeetodiga on tõestatud. See meetod rakendub kõigile täitematerjalidele, kaasa arvatud kergtäitematerjalid kuni suurima nimimõõduni 90 mm, filler välja arvatud.

MÄRKUS 1 Fillerite terastikulise koostise määramine on spetsifitseeritud standardis EN 933-10 Assessment of fines — Grading of filler aggregates (air jet sieving).

MÄRKUS 2 Pesemiseta kuivsoelumist võib kasutada nende täitematerjalide puhul, mis ei sisalda agregeerumist põhjustavaid osiseid.

Identne: EN 933-1:2012

EVS-EN 933-3:2012

Täitematerjalide geomeetriliste omaduste katsetamine. Osa 3: Tera kuju määramine. Plaatsustegur

Euroopa standard kirjeldab täitematerjali plaatsusteguri määramise põhimeetodit tüübikatsete ja lahkarvamuste puhul. Muudel juhtudel, näiteks tehase tootmisohjes, võib kasutada muid meetodeid juhul, kui eelnevalt on kindlaks määratud kasutatava meetodi suhestumine põhimeetodiga. See Euroopa standard rakendub looduslikele, tööstuslikult toodetud või taaskasutatavatele täitematerjalidele. Selles standardi osas kirjeldatud katsemeetodika ei ole rakendatav teradele mõõduga alla 4 mm ja üle 100 mm.

Tarkvaratehnika. Tarkvaratoote kvaliteedinõuded ja kvaliteedi hindamine (SQuaRE). Sarja SQuaRE teejuht

See standard annab juhiseid tarkvaratoote kvaliteedinõuete ja kvaliteedi hindamise uue standardisarja (SQuaRE) kasutamiseks. Selle teejuhi eesmärk on anda üldine ülevaade sarja SQuaRE sisust, ühistest etalonmudelitest ja määratlustest ning ka seostest dokumentide vahel, võimaldades kasutajail vastavalt nende kasutuseesmärkidele saada head ettekujutust sellest standardisarjast. Selles dokumendis seletatakse ülemineku protsessi vanadelt

sarjadelt ISO/IEC 9126 ja 14598 sarjale SQuaRE ning antakse ka teavet selle kohta, kuidas kasutada sarju ISO/IEC 9126 ja 14598 nende senisel kujul.

Standardisari SQuaRE on mõeldud, kuid mitte ainult, tarkvaratoodete väljatöötajaile, hankijaile ja sõltumatuile hindajaile, eriti neile, kes vastutavad tarkvara kvaliteedinõuete spetsifitseerimise ja tarkvaratoodete hindamise eest. Sarja SQuaRE ning ka standardisarjade ISO/IEC 14598 ja 9126 kasutajail on soovitatav kasutada ka käesolevat standardit juhiseina oma ülesannete täitmisel.

EVS-EN 54-1:2011/AC:2012

Automaatne tulekahjusignalisatsioonisüsteem. Osa 1: Sissejuhatus

Parandus on konsolideeritud standardisse EVS-EN 54-1:2011

APRILLIKUUS KINNITATUD JA MAIKUUS MÜÜGILE SAABUNUD EESTIKEELSE STANDARDID

EVS-EN 15221-6:2011

Kinnisvarakeskkonna juhtimine. Osa 6:

Pinna ja kubatuuri mõõtmine

kinnisvarakeskkonna juhtimisel 17,08

Eesti standard on Euroopa standardi EN 15221-6:2011 ingliskeelse teksti sisu poolest identne tõlge eesti keelde.

See Euroopa standard loob kinnisvarakeskkonna juhtimises ühtse aluse plaanijatele ja projekteerijatele, pinna ja kubatuuri korraldusele, maksumushinnangutele, aga on ka võrdlusuuringute abivahend.

See standard sätestab pinna ja kubatuuri mõõtmise nii olemas- kui ka plaanisel või arendamisel olevates omandi- või üürimajades. Standard esitab raamistiku pindade mõõtmiseks hoone sees ja sellest väljas. Lisaks on esitatud selged mõisted ja määratlused ning meetodid horisontaalsete pindade ja kubatuuri mõõtmiseks hoonetes ja/või selle osades, sõltumata nende funktsioonist.

EVS-EN 1090-1:2009+A1:2011

Teras- ja alumiiniumkonstruktsioonide valmistamine. Osa 1: Kandeelementide vastavushindamine 16,10

Eesti standard on Euroopa standardi EN 1090-1:2009+A1:2011 ingliskeelse teksti sisu poolest identne tõlge eesti keelde.

Standard spetsifitseerib ehitustoodetena kasutatavate terasest ja alumiiniumist kandeelementide ja montaaži-komplektide vastavustõendamise nõuded. Vastavustõendamine hõlmab valmistuskarakteristikuid ja kui see on vajalik, siis ka kande- võimekarakteristikuid.

See standard hõlmab ka terasest ja betoonist komposiitkonstruktsioonide teraselementide vastavustõendamise nõudeid. Elemente võib kasutada vahetult kandekonstruktsioonis või montaažikomplektides.

Standard rakendub nii seeriaviisiliselt kui ka üksikult valmistatavatele kandeelementidele, kaasa arvatud montaažikomplektidele.

Elementid võivad olla valmistatud kuumvaltsitud, külmvormitud või muu tehnoloogiaga valmistatud koostis-toodetest. Elementid võivad olla valmistatud erikujulise profiiliga terasest või alumiiniumist lehttoodetest (leht-, ribaterasest ja plekist), varrastest, valanditest, sepiestest, kas korrosiooni eest kaitsmata või pindamise või mõne muu pinnatöötusega kaitstud, näiteks alumiiniumi anodeerimisega.

See standard hõlmab ka standarditele EN 1993-1-3 ja EN 1999-1-4 vastavaid külmvormitud kandeelemente ja profiilplekki. See standard ei käsitle ripplagede elementide, raudteesüsteemide rööbaste ja liiprite vastavustõendamist.

MÄRKUS Teatud teras- ja alumiinium-elementide toimivuskarakteristikute ja teiste nõuete kohta on välja töötatud erispetsifikatsioonid. Need võivad olla avaldatud Euroopa standarditena või Euroopa standardite jaotistena. Näide on toodud standardis EN 13084-7 ühekordse seinaga teraskorstnate ja terasvoodrite kohta. Need spetsifikatsioonid on selle standardi suhtes prioriteetsed.

EVS-EN ISO 13485:2012

Meditiiniseadmed.

Kvaliteedijuhtimissüsteem. Normatiivsed nõuded 22,15

Eesti standard on Euroopa standardi EN ISO 13485:2012 ingliskeelse teksti sisu poolest identne tõlge eesti keelde.

See rahvusvaheline standard täpsustab kvaliteedijuhtimissüsteemi nõudeid, kus organisatsioon peab näitama oma suutlikkust pakkuda meditsiiniseadmeid ja seotud teenuseid, mis vastavad järjekindlalt kliendi nõuetele ja normatiivsetele nõuetele, mida

rakendatakse meditsiiniseadmetele ja seotud teenustele.

Selle rahvusvahelise standardi esmane eesmärk on lihtsustada meditsiiniseadmete kvaliteedijuhtimissüsteemide ühtlustatud normatiivseid nõudeid. Selle tulemusena sisaldab see mõnda konkreetset meditsiiniseadmete kohta käivat normatiivset nõuet ja jätab välja mõned

normatiivseteks nõueteks mittesobivad standardi ISO 9001:2000 nõuded. Nende väljajätmiste tõttu ei saa organisatsioonid, kelle kvaliteedijuhtimissüsteem on vastavuses selle rahvusvahelise standardiga, taotleda vastavust standardile ISO 9001:2000, kuni nende kvaliteedijuhtimissüsteem on vastavuses kõigi standardi ISO 9001:2000 nõuetega (vt lisa B).
