EVS TEATED

EVS/PK 45 „Katusehitusreeglid“ tegevuse lõpetamine

Eesti Standardikeskus annab teada, et novembrist 2013 on tühistatud EVS/PK 45 „Katusehitusreeglid“ registreering.

EVS/PK 45 tegevuse käigus koostati 4 Eesti standardit:

EVS 920-1:2013 „Katuseehitusreeglid. Osa 1: Üldreeglid“
EVS 920-2:2013 „Katuseehitusreeglid. Osa 2: Metallkatused“
EVS 920-3:2013 „Katuseehitusreeglid. Osa 3: Kiudsement laineplaadist katused“
EVS 920-4:2013 „Katuseehitusreeglid. Osa 4: Kivikatused“

CEN ISO/TS 17444-2:2013

Elektrooniline maksukogumine. Süsteemi toimivus. Osa 2: Kontrolli alused
Electronic fee collection - Charging performance - Part 2: Examination Framework (ISO/TS 17444-2:2013)

This specification provides the necessary elements and framework to define the examination methodologies for the consistent determination of charging performance for electronic fee collection (EFC) systems. Part 1, Metrics, describes a set of metrics

with appropriate definitions, principles and formulations, which together make up a reference framework for the examination of the charging performance of EFC systems. This technical specification - Part 2: Examination framework, will describe the examination framework for the metrics identified in Part 1 for both discrete and continuous toll schemes. The examination framework will identify and describe examination methods for the metrics that are relevant for:- - Evaluation - assessments carried out during a limited time span, such as when formulating requirements and assessing systems for acquisition purposes, conducting acceptance testing as part of the commissioning process, or as part of a certification procedure the implementation and operation phases of an EFC Scheme. - Monitoring - assessments needed as an ongoing supervision process, throughout the lifetime of a system, in order to validate contracted service levels, to identify fraud or malfunction, or to support ongoing maintenance and performance improvement processes. The definition of the examination methods to compute the identified metrics should be - independent of internal OBE technology - repeatable by various examining entities - provide comparable results for common test conditions It should be noted that tests for anticipating the performance in one system (scheme) by transposing achieved results in another system (scheme) is not within the scope. System certification is not in the current objectives either.

EVS 875-10:2013

Vara hindamine. Osa 10: Andmete kogumine ja analüüs, vara ülevaatus

Property valuation - Part 10: Data collection and analysis, property inspection

Standardisari EVS 875 käitleb vara hindamist. Standardite kasutusalaks on vara hindamise ja hinnangute kasutamisega seotud tegevused. Standardite kasutajateks on vara hindajad, kinnisvara-, ehitus- ja keskkonnaspetsialistid, finantsaruandlusega tegelevad spetsialistid (raamatupidajad, auditorid), krediidiasutused, kõrgemad õppeasutused. Standardisari loob aluse vara hindamise ühtsele käsitlusel, rahuldades nii era- kui ka avaliku sektori vajadusi. See standard käitleb andmete kogumist hindamistoimingu käigus ja vara ülevaatust kui selle üht tähtsaimat osa, samuti vara analüüsni.

Qualification testing of welders - Fusion welding - Part 1: Steels (ISO 9606-1:2012 including Cor 1:2012)

This part of ISO 9606 specifies the requirements for qualification testing of welders for fusion welding of steels. It provides a set of technical rules for a systematic qualification test of the welder, and enables such qualifications to be uniformly accepted independently of the type of product, location and examiner or examining body. When qualifying welders, the emphasis is placed on the welder's ability manually to manipulate the electrode, welding torch or welding blowpipe, thereby producing a weld of acceptable quality. The welding processes referred to in this part of ISO 9606 include those fusion-welding processes which are designated as manual or partly mechanized welding. It does not cover fully mechanized and automated welding processes. NOTE For such processes, see ISO 14732.

CEN ISO/TS 17919:2013

Microbiology of the food chain - Polymerase chain reaction (PCR) for the detection of food-borne pathogens - Detection of botulinum type A, B, E and F neurotoxin-producing clostridia (ISO/TS 17919:2013)

This Technical Specification specifies a horizontal method for the molecular detection of clostridia carrying botulinum neurotoxin A, B, E and F genes by a PCR method. This method detects the genes and not the toxins, therefore a positive result does not necessarily mean the presence of these toxins in the sample investigated. This Technical Specification is applicable to products for human consumption, animal feeding stuffs and environmental samples. The PCR assays for detection of genetic sequences encoding specific toxin types are described in the annexes B to C.

EVS-EN ISO 4833-1:2013

Microbiology of the food chain - Horizontal method for the enumeration of microorganisms - Part 1: Colony count at 30 degrees C by the pour plate technique (ISO 4833-1:2013)

This part of ISO 4833 specifies a horizontal method for enumeration of microorganisms growing in a solid medium after aerobic incubation at 30 °C. The method is applicable to: a) products intended for human consumption and for animal feed; b) environmental samples in the area of food and feed production and handling. This part of ISO 4833 is applicable to: 1) products that require a reliable count when a low limit of detection is specified (below 102/g or 102/ml for liquid samples or below 103/g for solid samples); 2) products expected to contain spreading colonies that obscure colonies of other organisms, e.g. Milk and milk products likely to contain preying *Bacillus* spp. The applicability of this part of ISO 4833 to the examination of certain fermented food and animal feeds is limited and other media or incubation conditions can be more appropriate. However, this method can be applied to such products even though it is possible that the predominant microorganisms in those products are not detected effectively. For some matrices, the method specified in this part of ISO 4833 can give different results to those obtained using the method specified in ISO 4833-2.

EVS-EN ISO 4833-2:2013

Microbiology of the food chain - Horizontal method for the enumeration of microorganisms - Part 2: Colony count at 30 degrees C by the surface plating technique (ISO 4833-2:2013)

This International Standard specifies a method for enumeration of the total aerobic colony count of microorganisms at 30°C by means of a surface enumeration technique. The method is applicable to - products intended for human consumption or for animal feeding stuffs - environmental samples in the area of food production and food handling. This technique is recommended when the organisms present in the sample are mainly expected to be obligately aerobic, psychrophilic or likely to be damaged by the temperature of molten agar, for example in refrigerated foods. It may also be used for intensely coloured food products. The technique enables colony morphology to be clearly seen. This method also describes the use of a spiral plater, an accurate and rapid method of performing surface colony counts.

Packaging - Requirements for measuring and verifying the four heavy metals and other dangerous substances present in packaging, and their release into the environment - Part 2: Requirements for measuring and verifying dangerous substances present in packaging, and their release into the environment

This document specifies the methodology and procedure for determining the presence and minimisation of other dangerous substances in relation with Annex II Para 1 Indent 3 of Directive 94/62/EC. This document is intended to be of practical use, and to enable efficient application of the Directive 94/62/EC, even for small and medium sized companies in the packaging industry, providing them with a methodology for assessing compliance with the Directive. This document cannot by itself provide presumption of conformity. The procedure for applying this document is contained in EN 13427.

Ergonomic design of control centres - Part 4: Layout and dimensions of workstations (ISO 11064-4:2013)

This part of ISO 11064 specifies ergonomic principles, recommendations and requirements for the design of workstations found in control centres. It covers workstation design with particular emphasis on layout and dimensions. This standard covers primarily seated, visual-display-based workstations although control workstations at which operators stand are also addressed.

These different types of workstation are to be found in applications such as transportation control, process control and security installations. Most of these workstations now incorporate flat displays screens for the presentation of information.

Non-destructive testing - Characterization and verification of ultrasonic examination equipment - Part 3: Combined equipment

This European Standard describes methods and acceptance criteria for verifying the performance of ultrasonic equipment (i.e. instrument and probe combined as defined in EN 12668 1 and EN 12668 2) by the use of appropriate standard calibration blocks. These methods are not intended to prove the suitability of the equipment for particular applications. The methods described are suitable for the use by operators working under site or shop floor conditions. The methods only apply to pulse echo equipment using A-scan presentation, with gain controls or attenuators calibrated in steps not greater than 2 dB and used essentially in contact testing. These methods are specifically intended for manual testing equipment. For automated testing different tests can be needed to ensure satisfactory performance.

Kompressorid ja vaakumpumbad. Ohutusnõuded. Osa 3: Kompressorid gaasidele, mis ei ole õhk, lämmastik või inertgaasid

Compressors and vacuum pumps - Safety requirements - Part 3: Process compressors

This European Standard is applicable to process gas compressors and process gas compressor units having an operating pressure greater than 0,5 bar (gauge), an input shaft power greater than 0,5 kW and designed to compress all gases other than air, nitrogen or inert gases which are covered in Part 1. This document deals with all significant hazards, hazardous situations and events relevant to the design, installation, operation, maintenance, dismantling and disposal of process gas compressors and process gas compressor units, when they are used as intended and under conditions of misuse which are reasonably foreseeable by the manufacturer (see Clause 4). This part of EN 1012 includes under the general term compressor units those machines which comprise: - the compressor; - a drive system including the prime mover; - any component or device supplied which is necessary for operation. This part of EN 1012 is not applicable to compressors which are manufactured before the date of publication of this document by CEN. The requirements of this European Standard do not take into account the interaction between the compressor/compressor unit and other processes carried out on site. Excluded are: - refrigerant compressors used in refrigerating systems or heat pumps for which the safety requirements are given in EN 60335-2-34 or EN 12693; - the specification of performance levels and/or safety integrity levels for safety related parts of control systems. Performance levels and/or safety integrity levels are an important aspect of compressor design and should be determined by the manufacturer and the user based on a risk assessment (see Introduction). This European Standard does not cover those safety aspects of road transport dealt with by EC legislation for trailers.

LPG equipment and accessories - Welded steel pressure vessels for LPG road tankers - Design and manufacture

This European Standard specifies minimum requirements for materials, design, construction and workmanship procedures, and tests for welded LPG road tanker pressure vessels and their welded attachments manufactured from carbon, carbon/manganese and micro alloy steels. There is no upper size limit as this is determined by the gross vehicle weight limitation. This European Standard does not cover pressure vessels for pressure vessel containers. NOTE 1 In the context of this standard the term "road tanker" is understood to mean "fixed tanks" and "demountable tanks" as defined in ADR. NOTE 2 The equipment for the pressure vessels and the inspection and testing after assembly is covered by EN 12252 and EN 14334, respectively. NOTE 3 The design type of the road tanker is subject to approval by the competent authority, as required by ADR.

EVS-EN ISO 1179-1:2013

Connections for general use and fluid power - Ports and stud ends with ISO 228-1 threads with elastomeric or metal-to-metal sealing - Part 1: Threaded ports (ISO 1179-1:2013)

This part of ISO 1179 specifies dimensions for ports with ISO 228-1 threads for use with non-adjustable stud ends described in ISO 1179-2, ISO 1179-3 and ISO 1179-4 and with adjustable stud ends described in ISO 1179-3. Ports in accordance with this part of ISO 1179 are applicable for use with — ISO 1179-2 heavy-duty (S series) stud ends with type E sealing at working pressures up to 63 MPa (630 bar) and light-duty (L series) stud ends at working pressures up to 25 MPa (250 bar), — ISO 1179-3 light-duty (L series) stud ends with type G sealing at working pressures up to 31,5 MPa (315 bar) and ISO 1179-3 light-duty (L series) adjustable stud ends with type H sealing at working pressures up to 20 MPa (200 bar), and — ISO 1179-4 stud ends with type B sealing at working pressures up to 40 MPa (400 bar) for the S series, up to 25 MPa (250 bar) for the L series, and up to 10 MPa (100 bar) for the LL series, except for the G2 size port, which in hydraulic fluid power systems is used mainly with accumulators and for which ISO 1179-3 and ISO 1179-4 do not specify stud ends. The permissible working pressure depends upon size, materials, design, working conditions, application, etc. Users of this part of ISO 1179 should ensure that there is sufficient material around the port to maintain the pressure. NOTE The introduction of this part of ISO 1179 gives recommendations for ports and stud ends to be used for new designs in hydraulic and pneumatic fluid power applications.

Connections for general use and fluid power - Ports and stud ends with ISO 228-1 threads with elastomeric or metal-to-metal sealing - Part 2: Heavy-duty (S series) and light-duty (L series) stud ends with elastomeric sealing (type E) (ISO 1179-2:2013)

This part of ISO 1179 specifies dimensions, performance requirements and test procedures for heavy-duty (S series) and light-duty (L series) stud ends with ISO 228-1 threads and the elastomeric sealing (type E) that is used with them. Heavy-duty (S series) stud ends with type E sealing in accordance with this part of ISO 1179 may be used at working pressures up to 63 MPa (630 bar). Light-duty (L series) stud ends with type E sealing in accordance with this part of ISO 1179 may be used at working pressures up to 25 MPa (250 bar). The permissible working pressure depends upon size, materials, design, working conditions, application, etc. Conformance to the dimensional information in this part of ISO 1179 does not guarantee rated performance. Each manufacturer shall perform testing according to the specification contained in this part of ISO 1179 to assure that components made to this part of ISO 1179 comply with the performance ratings. NOTE 1 This part of ISO 1179 applies to connectors detailed in ISO 8434-1 and ISO 8434-2. NOTE 2 The introduction of this part of ISO 1179 gives recommendations for ports and stud ends to be used for new designs in hydraulic and pneumatic fluid power applications.

Qualification testing of welders - Fusion welding - Part 1: Steels (ISO 9606-1:2012 including Cor 1:2012)

This part of ISO 9606 specifies the requirements for qualification testing of welders for fusion welding of steels. It provides a set of technical rules for a systematic qualification test of the welder, and enables such qualifications to be uniformly accepted independently of the type of product, location and examiner or examining body. When qualifying welders, the emphasis is placed on the welder's ability manually to manipulate the electrode, welding torch or welding blowpipe, thereby producing a weld of acceptable quality. The welding processes referred to in this part of ISO 9606 include those fusion-welding processes which are designated as manual or partly mechanized welding. It does not cover fully mechanized and automated welding processes. NOTE For such processes, see ISO 14732.

27 ELEKTRI- JA SOOJUSENERGEETIKA

EVS-EN ISO 9806:2013

Solar energy - Solar thermal collectors - Test methods

This International Standard specifies test methods for assessing the durability, reliability and safety for fluid heating collectors. This International Standard also includes test methods for the thermal performance characterization of fluid heating collectors, namely steady-state and quasi-dynamic thermal performance of glazed and unglazed liquid heating solar collectors and steady-state thermal performance of glazed and unglazed air heating solar collectors (open to ambient as well as closed loop). This International Standard is also applicable to hybrid collectors generating heat and electric power. However it does not cover electrical safety or other specific properties related to electric power generation. This International Standard is also applicable to collectors using external power sources for normal operation and/or safety purposes. This International Standard is not applicable to those collectors in which the thermal storage unit is an integral part of the collector to such an extent that the collection process cannot be separated from the storage process for the purpose of making measurements of these two processes.

29 ELEKTROTEHNIKA

EVS-EN 50110-1:2013

Elektripaigaldiste käit. Osa 1: Üldnõuded

Operation of electrical installations -- Part 1: General requirements

See Euroopa standard kehtib elektripaigaldiste käidul ja elektripaigaldistes, nende juures või lähedal sooritatavate kõigi töötoimingute kohta. Siia kuuluvad paigaldised, mis talitlevad pingetasemetel alates väikepingest kuni kõrgepingeni. Termin kõrgepinge hõlmab ka neid pingetasemeid, mida nimetatakse keskpingleks ja ülikõrgepingeks. Nimetatud elektripaigaldised on ette nähtud elektrienergia tootmiseks, edastamiseks, muundamiseks, jaotamiseks ja kasutamiseks. Mõned nendest (nt tööstusettevõtete ja asutuste elektrijaotuspaigaldised) on kestvtoimelised ja kohtkindlad, teised (nt ehitusplatsidel) on ajutised, kolmandad aga liikuvad või teisaldatavad kas pingestatud olekus või pinge- ja laenguvabadena (nt elektrijamiga kaevandusmasinad karjäärides ja ava-sõekaevandustes). See Euroopa standard sätestab elektripaigaldiste ohutu käidu ja elektripaigaldistes, nende juures või lähedal sooritatavate töötoimingute ohutusnõuded. Need nõuded kehtivad operatiiv-, töö- ja hooldetoiingute kohta. Need kehtivad ka kõigi nii mitteelektritööde (nt õhu- või kaabelliinide läheduses tehtavate ehitustööde) kui ka elektritööde kohta, kui on tegemist elektrilise ohuga. See Euroopa standard ei laiene paigaldisi ja seadmeid kasutavatele tavaiskutile, kui paigaldised ja seadmed on projekteeritud ja paigaldatud sellistena, et neid võivad kasutada tavaasikud ning et nad vastavad sellekohaste standardite nõuetele. See Euroopa standard ei ole spetsiaalselt mõeldud kohaldamiseks allpool loetletud elektripaigaldistele. Kui aga ei ole muid juhiseid ega töötamisreegleid, võib selle standardi põhimõtteid rakendada ka — mis tahes omal jõul liikuvatele õhu- või hõljuksöidukitele (need alluvad rahvusvahelistele lennundusnõuetele, mis on sel juhul rahvuslike nõuete ees ülimuslikud); — mis tahes omal jõul liikuvatele või veetavatele meresöidukitele (need alluvad rahvusvahelistele merendusnõuetele, mis on sel juhul rahvuslike nõuete ees ülimuslikud); — elektroonilistele telekommunikatsiooni- ja infosüsteemidele; — elektronaparatuuril põhinevatele mööte-, juhtimis- ja automaatikasüsteemidele; — sõe- jm kaevandustele; — rahvusvahelistele merendusnõuetele alluvatele merepaigaldistele; — söidukitele; — elekterveosüsteemidele; — elektrialastele eksperimentaaluurimispaigaldistele.

High-voltage switchgear and controlgear -- Part 4: Handling procedures for sulphur hexafluoride (SF₆) and its mixtures

IEC 62271-4:2013 applies to the procedures for handling of SF₆ during installation, commissioning, normal and abnormal operations, disposal at the end of life of high voltage switchgear and controlgear. This first edition cancels and replaces the first edition of IEC/TR 62271-303 published in 2008. This first edition constitutes a technical revision. This edition includes the following significant technical changes with respect to the previous edition: a) the description of the potential effects on health of SF₆ by products (former Annex D of IEC/TR 62271-303:2008) has been replaced by the calculation methods for evaluating of the potential effects on health of SF₆ by products (see Annex H); b) information about cryogenic reclaim of SF₆. Have been added (see Annex I); c) handling procedures for the most popular SF₆ mixtures have been added (see Annex J).

Overhead lines - Methods for testing self-damping characteristics of conductors

IEC 62567:2013 provides test procedures based on the documents mentioned in the introduction and devoted to minimize the causes of discrepancy between test results, taking into consideration the large experience accumulated in the last 30 years by numerous test engineers and available in literature, including a CIGRE Technical Brochure specifically referring to this standard (see Bibliography). This Standard describes the current methodologies, including apparatus, procedures and accuracies, for the measurement of conductor self-damping and for the data reduction formats. In addition, some basic guidance is also provided to inform the potential user of a given method's strengths and weaknesses. The methodologies and procedures incorporated in this Standard are applicable only to testing on indoor laboratory spans. Key words: Overhead lines, Self-damping, Conductors

Connector sets and interconnect components to be used in optical fibre communication systems - Product specifications -- Part 17-1: Type FPFT (factory polished field terminated) simplex connector factory terminated with EN 60793-2-50 category B1.3 fibre and field mounted onto IEC 60793-2-50 category B1.3 or B6a_1 or B6a_2 singlemode fibre, category C

1.1 Product definition This European Standard contains the initial, start of life dimensional, optical, mechanical and environmental performance requirements that a Factory Polished Field Terminated (FPFT) single mode simplex connector set (plug adaptor plug), adaptor will meet in order for it to be categorised as an EN standard product. The FPFT is designed for either fusion or mechanical splice methods. The performance is specified for the mated combination between a FPFT plug and an EN standardised plug from the EN 50377 series (configuration 1) or between two FTFP plugs (configuration 2). The fibre specified inside the FPFT plug in this European Standard is standard single mode fibre with low water peak as specified as B1.3, which is field, mated to B1.3 fibre or bend insensitive single mode fibre specified as B6_a1 or B6_a2 in EN 60793-2-50. Mixing standard and bend insensitive fibres in a connection causes a considerable intrinsic attenuation due to mode field diameter mismatch. These connectors are intended to be installed inside wall outlets or other fibre organisers, and are therefore considered as being in a "protected environment" and are terminated onto either 250 µm primary coated or up to 900 µm buffered fibres. Since different variants and grades of performance are permitted, product marking details are given in 3.5. 1.2 Intermateability 1.2.1 Mechanical intermateability In order to meet mechanical performance requirements, the FPFT plug will meet the optical, environmental and mechanical requirements as stated in this European Standard and the mated plug will meet the all requirements of the relevant EN 50377 series for category C. Intermateability between the FPFT plug and its standard EN 50377 counterpart can only be guaranteed when both plugs meet the same EN 50377 product specification mechanical connector interface dimensions and endface geometry requirements. 1.2.2 Optical intermateability In EN 50377 product specifications, the random mated performance is calculated when the two connector plugs have been terminated with single-mode fibres using a worst case MFD. The specified MFD range in fibre standards (e.g. B1.3 fibres) is 8,0 µm to 10,1 µm at 1 310 nm, which causes 0,22 dB worst case intrinsic attenuation. However, in EN 50377 product specification series, the MFD is limited to 8,9 µm to 9,5 µm at 1 310 nm. In this European Standard, in order to achieve the random mate performance values, the total MFD range of bend insensitive fibres, e.g. B6a fibres, is limited to 8,5 µm to 9,5 µm at 1 310 nm. This causes a worst case intrinsic attenuation of 0,05 dB. 1.3 Operating environment The tests selected, combined with the severities and durations, are representative of a category C environment as defined in EN 61753-1. The FPFT plugs are terminated on to 250 µm primary coated or up to 900 µm buffered fibres and are specified to be located in a protected environment. 1.4 Reliability Whilst the anticipated service life expectancy of the product in this environment is 20 years, compliance with this European Standard does not guarantee the reliability of the product. This should be predicted using a recognised reliability assessment programme. 1.5 Quality assurance Compliance with this European Standard does not guarantee the manufacturing consistency of the product. This should be maintained using a recognised quality assurance programme.

Mõõtereleed ja kaitseparatuur. Osa 26: Elektromagnetilise ühilduvuse nõuded Measuring relays and protection equipment - Part 26: Electromagnetic compatibility requirements

This part of IEC 60255 is applicable to measuring relays and protection equipment, taking into account combinations of devices to form schemes for power system protection including the control, monitoring, communication and process interface equipment used with those systems. This standard specifies the requirements for electromagnetic compatibility for measuring relays and protection equipment. For equipment not incorporating electronic circuits, for example electromechanical relays, tests according to this standard are not required. The requirements specified in this standard are applicable to measuring relays and protection equipment in a new condition and all tests specified are type tests only.

EVS-EN 61169-1:2013

Radio-frequency connectors -- Part 1: Generic specification - General requirements and measuring methods

IEC 61169-1:2013(E), which is a generic specification, relates to radio frequency connectors for r.f. transmission lines for use in telecommunications, electronics and similar equipment. It provides the basis for the sectional standards, which apply to individual connector types. It is intended to establish uniform concepts and procedures concerning: - terminology; - standard ratings and characteristics; - testing and measuring procedures concerning electrical, mechanical and climatic properties; - classification of connectors with regard to climatic testing procedures involving temperature and humidity. The test methods and procedures of this standard are intended for acceptance and type approval testing. This second edition cancels and replaces the first edition, published in 1992, its Amendments 1 (1996) and 2 (1997). This edition constitutes a technical revision. With respect to the previous edition, tests methods have been updated as well as terminology.

Application integration at electric utilities - System interfaces for distribution management -- Part 100: Implementation profiles

IEC 61968-100:2013 specifies an implementation profile for the application of the other parts of IEC 61968 using common integration technologies, including JMS and web services. This International Standard also provides guidance with respect to the use of Enterprise Service Bus (ESB) technologies. This provides a means to derive interoperable implementations of IEC 61968-3 to IEC 61968-9. At the same time, this International Standard can be leveraged beyond information exchanges defined by IEC 61968, such as for the integration of market systems or general enterprise integration.

CEN ISO/TS 14265:2013

Health Informatics - Classification of purposes for processing personal health information (ISO/TS 14265:2011)

ISO/TS 14265:2011 defines a set of high-level categories of purposes for which personal health information can be processed. This is in order to provide a framework for classifying the various specific purposes that can be defined and used by individual policy domains (e.g. healthcare organizations, regional health authorities, jurisdictions, countries) as an aid to the consistent management of information in the delivery of health care services and for the communication of electronic health records across organizational and jurisdictional boundaries. The scope of application of ISO/TS 14265:2011 is limited to Personal Health Information as defined in ISO 27799, information about an identifiable person that relates to the physical or mental health of the individual, or to provision of health services to the individual.

Electronic fee collection - Charging performance - Part 2: Examination Framework (ISO/TS 17444-2:2013)

This specification provides the necessary elements and framework to define the examination methodologies for the consistent determination of charging performance for electronic fee collection (EFC) systems. Part 1, Metrics, describes a set of metrics with appropriate definitions, principles and formulations, which together make up a reference framework for the examination of the charging performance of EFC systems. This technical specification - Part 2: Examination framework, will describe the examination framework for the metrics identified in Part 1 for both discrete and continuous toll schemes. The examination framework will identify and describe examination methods for the metrics that are relevant for:- - Evaluation - assessments carried out during a limited time span, such as when formulating requirements and assessing systems for acquisition purposes, conducting acceptance testing as part of the commissioning process, or as part of a certification procedure the implementation and operation phases of an EFC Scheme. - Monitoring - assessments needed as an ongoing supervision process, throughout the lifetime of a system, in order to validate contracted service levels, to identify fraud or malfunction, or to support ongoing maintenance and performance improvement processes. The definition of the examination methods to compute the identified metrics should be - independent of internal OBE technology - repeatable by various examining entities - provide comparable results for common test conditions. It should be noted that tests for anticipating the performance in one system (scheme) by transposing achieved results in another system (scheme) is not within the scope. System certification is not in the current objectives either.

CEN/TS 13149-8:2013

Public transport - Road vehicle scheduling and control systems - Part 8: Physical layer for IP communication

This Technical Specification specifies the physical layer of an onboard data transmission bus between the different equipment for service operations and monitoring of the fleet. This applies to equipment installed on board vehicles that are operating as part of a public transport network, i.e. in operation under public service contracts. This equipment includes operation aid systems, automatic passenger information systems, fare collection systems, etc. Equipment directly related to the safety-related functioning of the vehicle (propulsion management, brake systems, door opening systems, etc...) are excluded from the scope of this Technical Specification and are dealt with in other standardization bodies. Interfaces to such equipment or safety-critical networks can be provided through dedicated gateways. Part 8 covers the link between equipment inside vehicles consisting of one carriage only, e.g. buses and trolleybuses, as well as a set of carriages, e.g. trams and trains. For the described application, three communication systems are standardised under EN 13149. There is no ranking between the three communication systems. - Parts 1, 2 and 3 describe the WORLDFIP communication system; - Parts 4, 5 and 6 describe the CANopen communication system; - Parts 7, 8 and 9 describe the IP-based communication system. Part 7 of the 13149 series specifies the Network and System Architecture for onboard equipment. It describes basic principles of communications including a general description of the network topology, addresses schematics, basic network services, a system overview and basic device architecture. Part 8 of the 13149 series specifies the Physical Layer for IP-communication networks onboard PT vehicles. This part specifies the cables, connectors and other equipment including pin assignment and environmental requirements. Part 9 of the 13149 series specifies in detail the Profiles of basic and generic Services and Devices as well as profiles of specific services and devices. This part 8-1 specifies wired communication networks onboard PT vehicles which are based on the Ethernet specification IEEE 802.3 — 10 Base T and 100 Base Tx.

Internet Content and communications filtering software and services

The objective of this Technical Specification is to define a set of criteria on how Web filters shall perform and that shall give Internet users more confidence in choosing a suitable product or service in order to help protecting children online. NOTE A product is a software system that is installed by its administrator or its provider. A service is provided without specific installation by the administrator, but by direct provision of the customer by the provider. An example of a product is a software system installed on a personal computer, and an example of a service is an Internet connection filter provided by an Internet Service Provider and added on the Internet access service. By using a Web filter that complies with the requirements set out in this Technical Specification, a user can be confident that the product or service: a) has been specifically designed to meet the needs of parents and carers (administrators of the filter) to protect children from potentially harmful URLs on the Internet; b) has been specifically targeted to minors, and is also suited for individuals looking to protect themselves from potentially harmful URLs on the Internet; c) delivers a minimum set of features and efficacy that are sufficient to provide the required level of protection; d) comes with clear and comprehensive documentation, installation and implementation instructions and available support; e) is reasonably secure, i.e. adopts proven measures to prevent bypassing or removal of the filter itself. This Technical Specification does not cover the following technologies: f) any kind of email filtering, including: antispam filtering, antivirus analysis of emails and attachments, antiphishing filtering; g) other Web filtering for the purpose of enterprise or adult Web usage, including: antivirus analysis of Web content, antiphishing filtering; h) the analysis and/or filtering of any other application traffic delivered over HTTP/HTTPS/FTP including for instance: instant messaging, peer to peer file (P2P) sharing, VoIP; i) the analysis and/or filtering of any other application traffic delivered over non HTTP/HTTPS/FTP protocols including for instance: newsgroups, instant messaging, peer to peer file (P2P) sharing, VoIP and social networking applications.

EVS-ISO/IEC/IEEE 15289:2013

Süsteemi- ja tarkvaratehnika. Elutsükli infosaaduste (dokumentatsiooni) sisu Systems and software engineering -- Content of life-cycle information products (documentation) (ISO/IEC/IEEE 15289:2011)

See standard spetsifitseerib süsteemide ja tarkvara elutsükli kõigi piiritletud infoüksuste ning infotehnoloogiliste teenustega halduseks vajalike infoüksuste (dokumentatsiooni) otstarbe ja sisu. Infoüksuste sisu määratletakse vastavalt üldistuslikele dokumentitüüpidele, mis on esitatud peatükis 7, ja dokumendi konkreetsele otstarbele (peatükki 10). See standard eeldab, et organisatsioon rakendab elutsükli protsesse vastavalt standardile ISO/IEC 15288:2008 (IEEE Std 15288-2008) „Systems and software engineering — System life cycle processes“ või ISO/IEC 12207:2008 (IEEE Std 12207-2008) „Systems and software engineering — Software life cycle processes“, või sooritab teenusehaldust vastavalt standarditele ISO/IEC 20000-1:2005 „Information technology — Service management — Part 1: Specification“ ja ISO/IEC 20000-2:2005 „Information technology — Service management — Part 2: Code of practice“. ISO/IEC 12207:2008 (IEEE Std 12207-2008) ja ISO/IEC 15288:2008 (IEEE Std 15288-2008) määratlevad ühe protsessikogumi, millega hallata ja sooritada süsteemi elutsükli järke. Need määratlevad teabehalduse protsessi, kuid nad ei „detailiseeri dokumentatsiooni selle nimetuste, vormingu, otsese sisu ja talletava infokandja mõttes“ [ISO/IEC 15288:2008 (IEEE Std 15288-2008), 1.4]. ISO/IEC 12207:2008 (IEEE Std 12207-2008) rajab elutsükli protsessidele ühe ühise karkassi ning piiritleb see-juures rea dokumentatsiooniüksusi või nõuab neid. Protsessi etalonmudel ei esinda mingit kindlat lähenemis-viisi protsessi teostamisele ega kirjuta ette mingit süsteemi või tarkvara elutsükli mudelit, metoodikat ega meetodit. ISO/IEC 20000-1:2005 kehtestab üldised nõuded dokumentidele ja andmikele (3.2). ISO/IEC 12207:2008 (IEEE Std 12207-2008) ei täpsusta alati, millal tuleb koostada tarkvara infoüksused ega piiritle infoüksuste sisu. See standard seab ISO/IEC 15288:2008 (IEEE Std 15288-2008) ja ISO/IEC 12207:2008 (IEEE Std 12207-2008) jaotised vastavasse ühe infoüksuste kogumiga. Üldistuslikke dokumentitüüpide (mida võib nimetada infoüksuste tüüpideks) tuleb kasutada sellise teabe piirlemiseks, mida vajatakse ISO/IEC 15288:2008 (IEEE Std 15288-2008) leppe-, ettevõtte-, projekti- ja tehni-liste protsesside, ISO/IEC 12207:2008 (IEEE Std 12207-2008) primaar-, abi- ja organisatsiooniliste elutsükli-protsesside või ISO/IEC 20000-1:2005 teenusehalduse protsesside toetuseks. See standard piiritleb andmikud ja infoüksused ISO/IEC 15288:2008 (IEEE Std 15288-2008), ISO/IEC 12207:2008 (IEEE Std 12207-2008), ISO/IEC 20000-1:2005 ja ISO/IEC 20000-2:2005 viidete analüüsiga põhjal; mõnedel juhtudel pakuvad need viited konkreetsete dokumentide sisu täielikke või osalisi visandeid. Nõuded elutsükli protsessidele ei sõnasta aga üheselt ja ühemõtteliselt nõudeid infoüksuse sisule ega teabele, mida vajab infoüksuse kasutaja. Peale selle võib elutsükli protsessidest pärít teave osaliselt kattuda või see võidakse luua ja läbi vaadata eri aegadel. Ühesõnaga ei anna analüüsitud viited tulemuseks infoüksuste loogiliselt täielikku loetelu. Elutsükli iga protsessi puuhul oleks võimalik koostada plaani, protseduure ja aruandeid, samuti rohkeid andmikke, taotlusi, kirjeldusi ja spetsifikatsioone. Niisugune dokumentatsiooniskeemi detailiseering oleks rangem sellest, mida spetsifitseerib ISO/IEC 15288:2008 (IEEE Std 15288-2008) või ISO/IEC 12207:2008 (IEEE Std 12207-2008). Nagu rõhutab ISO/IEC 15288:2008 (IEEE Std 15288-2008) (jaotis 1.4): „See standard ei detailiseeri elutsükli protsesse neile esitatavate nõuetega rahuldamiseks ja tulemiste saavutamiseks vajalike meetodite ega protseduuride mõttes.“ Niisiis võib infoüksusid vastavalt projekti või organisatsiooni eesmäärkidest tulenevatele vajadustele ühendada või tükkeldada; lähemalt on seda käsitletud peatükis 2 („Rakendatus“) ja peatükis 3 („Vastavus“). Selle standardi käsitlusallasse ei kuulu: a) soovitatavate lähteandmete või lähte-infoüksuste vorming või sisu, välja arvatud niisugust lähteüksuste sisu, mis on ühtlasi tulem-infoüksused; b) loomult sarnaste infoüksuste ja nende sisu ühendamise või tükkeldamise juhised; c) süsteemi ja tarkvara elutsükli andmete, andmike, infoüksuste või dokumentatsiooni sobiva esitus-vormingu, väljastuskandja ja hooldustehnoloogia, näiteks elektroonilise kirjastamise süsteemide, sisuhalduse süsteemide või andmehoidlate valimise juhised; d) äritegevuse, organisatsiooni ja rahanduse üldise haldusega seotud infoüksuste detailne sisu, mis ei ole spetsifiline süsteemi- ja tarkvaratehnika ega infotehnoloogia teenusehaldusele, näiteks äristrateegiad, inimressursi- ja investeeringimispoliitikad, personali valimise kriteeriumid, eelarvestuse ja rahalise arvestuse politikad ja protseduurid, kuluaruanded või palgaandmed; e) infoüksused, mis töendavad ainult ISO/IEC 12207:2008 (IEEE Std 12207-2008) ühe sätte, näiteks ISO/IEC 12207:2008 (IEEE Std 12207-2008), sätte 6.1.2.3.4.5 järgimist; f) ükski ISO/IEC 15288:2008 (IEEE Std 15288-2008) või ISO/IEC 12207:2008 (IEEE Std 12207-2008) sätte, mis ei määra otseselt ega kaudselt teabe jäädvustamist mingi tegevuse või töö kohta, näiteks ISO/IEC 12207:2008 (IEEE Std 12207-2008) sätte 6.4.4; g) töösaadused, mudelid, tarkvara ning muud elutsükli saaduste ja teenuste tehised, mis ei ole infoüksused ega infoüksustes kasutatavad andmikud. MÄRKUS 1 Tarkvara kasutajadokumentatsiooni vormingute kohta annab juhiseid ISO/IEC 26514:2008 „Systems and software engineering — Requirements for designers and developers of user documentation“. MÄRKUS 2 Töösaaduste ja infoüksuste sisu detailiseerib ISO/IEC TR 15504-5:1999 „Information technology — Software Process Assessment — Part 5: An assessment model and indicator guidance“. Selle juhised kirjeldavad infoüksuste (dokumentide) kogumit, millega hindajal tuleb võib-olla tegemist teha. Nendes juhistes nimetatud infoüksusi võidakse luua selles standardis nõutavaid infoüksusi ühendades ja tükkeldades.

CEN/TS 13149-8:2013

Public transport - Road vehicle scheduling and control systems - Part 8: Physical layer for IP communication

This Technical Specification specifies the physical layer of an onboard data transmission bus between the different equipment for service operations and monitoring of the fleet. This applies to equipment installed on board vehicles that are operating as part of a public transport network, i.e. in operation under public service contracts. This equipment includes operation aid systems, automatic passenger information systems, fare collection systems, etc. Equipment directly related to the safety-related functioning of the vehicle (propulsion management, brake systems, door opening systems, etc) are excluded from the scope of this Technical Specification and are dealt with in other standardization bodies. Interfaces to such equipment or safety-critical networks can be provided through dedicated gateways. Part 8 covers the link between equipment inside vehicles consisting of one carriage only, e.g. buses and trolleybuses, as well as a set of carriages, e.g. trams and trains. For the described application, three communication systems are standardised under EN 13149. There is no ranking between the three communication systems. - Parts 1, 2 and 3 describe the WORLDVIP communication system; - Parts 4, 5 and 6 describe the CANopen communication system; - Parts 7, 8 and 9 describe the IP-based communication system. Part 7 of the 13149 series specifies the Network and System Architecture for onboard equipment. It describes basic principles of communications including a general description of the network topology, addresses schematics, basic network services, a system overview and basic device architecture. Part 8 of the 13149 series specifies the Physical Layer for IP-communication networks onboard PT vehicles. This part specifies the cables, connectors and other equipment including pin assignment and environmental requirements. Part 9 of the 13149 series specifies in detail the Profiles of basic and generic Services and Devices as well as profiles of specific services and devices. This part 8-1 specifies wired communication networks onboard PT vehicles which are based on the Ethernet specification IEEE 802.3 — 10 Base T and 100 Base Tx.

45 RAUDTEETEHNIKA

CLC/TS 50591:2013

Specification and verification of energy consumption for railway rolling stock

This document is applicable to the specification and verification of energy consumption of railway rolling stock. It establishes a criterion for the energy consumption of rolling stock to calculate the total net energy consumed, either at pantograph or from the fuel tank, over a predefined service profile, in order to assure results directly comparable or representative for the real operation of the train. For this purpose this document takes into account the energy consumed and regenerated by the rolling stock. This Technical Specification provides the framework which guides to generate comparable energy performance values for trains and locomotives on a common basis and thereby supports benchmarking and improvement of the energy efficiency of rail vehicles. This document does not cover specification for comparison of energy consumption with other modes of transportation, or even for comparison between diesel and electric traction, dealing only with the energy consumption of the Railway rolling stock itself. Consequently this document is not applicable to the evaluation of the carbon foot print of the railways transportation system.

Railway applications - Aerodynamics - Part 4: Requirements and test procedures for aerodynamics on open track

This European Standard deals with requirements, test procedures and conformity assessment for aerodynamics on open track. Addressed within this standard are the topics of aerodynamic loadings and resistance to motion, while the topic of cross wind assessment is addressed by EN 14067-6. This European Standard refers to rolling stock and infrastructure issues. This standard does not apply to freight wagons. It applies to railway operation on gauges GA, GB and GC according to EN 15273. The methodological approach of the presented test procedures may be adapted to different gauges.

Electronic railway equipment - On board driving data recording system -- Part 1: System specification

IEC 62625-1:2013 covers the specification of an on board driving data recording system for the purpose of recording data about the operation of the train. The data refers both to the driver behaviour and the on board systems behaviour to support systematic safety monitoring as a means of preventing incidents and accidents. The data is recorded in a way that is suitable for identifying cause and where possible consequence, such that the data is suitable: - for investigative use in case of accidents and incidents; - to monitor the appropriate actions of drivers. This standard specifies the requirements for a universal recording system that is applicable to all types of rail vehicles.

Mullaparandajad ja kasvukeskkond. Proovivõtt Soil improvers and growing media - Sampling

This European Standard specifies methods for sampling soil improvers and growing media (excluding liming materials) for subsequent determination of quality and quantity. It outlines the principles to be taken into consideration when taking the sample and ensuring an adequate quantity is available for testing. This standard only applies to material in solid form, including pre-shaped media. This standard is intended to be used by manufacturers, buyers and enforcement agencies in verifying claims made for these products. It is not intended that it should necessarily be used for the purpose of manufacturing control. The requirements of this standard may differ from the national legal requirements for the declaration of the product concerned.

EVS-EN 12580:2013

Mullaparandajad ja kasvukeskkond. Koguse määramine Soil improvers and growing media - Determination of a quantity

This European Standard specifies methods for the determination of a quantity of soil improvers and growing media in bulk and in packages. This is a reference method, which is designed with an appropriate precision level so that it can be used to validate any quantity declaration made. This standard is applicable to material that is in solid form, reconstituted if necessary, but not to blocks sold as such by dimension; for these, see EN 15761. This method is not applicable for material with more than 10 % (V/V) of particles greater than 60 mm in size; for these, see EN 15238. The requirements of this standard may differ from the national legal requirements for the declaration of the products concerned. Where there is no legal requirement to use this method, for example in quantity control of packaged product, then it is permissible for any other methods to be used so long as these other methods can be demonstrated to be comparable with this standard method in giving the same quantity with the same precision. Material which has become excessively wet and which cannot be easily broken down into a flowable material will not be suitable for the determination of quantity and may not give a representative result. However, because of the diverse nature and bulk density of these materials, it is not possible to quantify what is 'excessive'. This standard is intended to be used by manufacturers, buyers and enforcement agencies in verifying claims made for these products. It is not intended that it should necessarily be used for the purpose of manufacturing control.

Põllumajandusmasinad. Sõnnikulaoturid. Ohutus Agricultural machinery - Manure spreaders - Safety

This European Standard, to be used together with EN ISO 4254-1, specifies the safety requirements and their verification for the design and construction of self-propelled, mounted, semi-mounted and trailede manure spreaders, provided with vertical or horizontal axes rotors rear spreader device or with vertical axes disc rear spreader device. In addition, it specifies the type of information on safe working practices to be provided by the manufacturer. When requirements of this document are different from those which are stated in EN ISO 4254-1, the requirements of this document take precedence over the requirements of EN ISO 4254-1 for machines that have been designed and built according the provisions of this document. This European Standard, taken together with EN ISO 4254-1, deals with all the significant hazards, hazardous situations and events relevant to manure spreaders, when they are used as intended and under the conditions of misuse which are reasonably foreseeable by the manufacturer (see Table 1), excepting the hazards arising from: - vibrations of self-propelled machinery; - travelling function of self-propelled machinery; - overturning in regard to the protection of the operator at the driving station of a self-propelled machine; - hazards related to conveying devices other than those defined in 3.3.1 and 3.3.2, for example load push/push-off device. NOTE 1 Regarding roll-over protection for self-propelled agricultural machinery, see EN ISO 16231-1. NOTE 2 This European Standard is neither applicable to environmental hazards nor to road safety. Environmental aspects are dealt with in EN 13080. This European Standard does not apply to manure spreaders with laterally mounted spreading device as defined in 3.6. This European Standard is not applicable to manure spreaders which are manufactured before the date of publication of this document by CEN.

Foods of plant origin - Multiresidue methods for the determination of pesticide residues by GC or LC-MS/MS - Part 1: General considerations

This European Standard gives general considerations for the determination of pesticide residues in foods of plant origin. Each method specified in this European Standard is suitable for identifying and quantifying a definite range of those organohalogen, and/or organophosphorus and/or organonitrogen pesticides which occur as residues in foodstuffs of plant origin. This European Standard contains the following methods that have been subjected to interlaboratory studies and/or are adopted throughout Europe: - method M: Extraction with acetone and liquid liquid partition with dichloromethane/light petroleum, if necessary clean-up on Florisil® 1) [1], [2], [3]; - method N: Extraction with acetone, liquid liquid partition with dichloromethane or cyclohexane/ethyl acetate and clean-up with gel permeation and silica gel chromatography [4], [5]; - method P: Extraction with ethyl acetate and, if necessary, clean-up with gel permeation chromatography [6]. The applicability of the three methods M, N and P for residue analysis of organohalogen, organophosphorus and organonitrogen pesticides, respectively, is given for each method.

Foods of plant origin - Multiresidue methods for the determination of pesticide residues by GC or LC-MS/MS - Part 2: Methods for extraction and clean-up

This European Standard specifies methods for the extraction and clean-up of food samples of plant origin for quantitative determination of pesticide residues. Different solvents can be used for this purpose. These pesticide residues are generally associated with other co-extracted compounds which would interfere in the analysis. To purify the crude extracts to be analysed,

several techniques can be used. This European Standard contains the following extraction and clean-up methods that have been subjected to interlaboratory studies and/or are adopted throughout Europe: - method M: Extraction with acetone and liquid-liquid partition with dichloromethane/light petroleum, if necessary clean-up on Florisil®) [1], [2], [3]; - method N: Extraction with acetone, liquid-liquid partition with dichloromethane or cyclohexane/ethyl acetate and clean-up with gel permeation and silica gel chromatography [4], [5]; - method P: Extraction with ethyl acetate, and if necessary, clean-up by gel permeation chromatography [6]. This European Standard specifies the details of methods M, N and P for the extraction and the clean-up of food samples of plant origin. Several solvents at different volumes are used for extraction. Techniques of clean-up are listed such as liquid-liquid partition, liquid chromatography on various adsorbents and gel permeation chromatography. A table providing the couples (matrix/pesticide) which have been submitted to collaborative studies and a list of indicative applicability of the method to different pesticides are given for each method, wherever possible.

Metallic materials - Sheet and strip - Erichsen cupping test (ISO 20482:2013)

This International Standard specifies a standard test method for determining the ability of metallic sheets and strips having a thickness from 0,1 mm up to 2 mm and a width of 90 mm or greater to undergo plastic deformation in stretch forming. For materials that are thicker and when only narrower strips are available, tools of specified dimensions are provided, in which case subscripts are used, as shown in Table 1.

Metallic materials - Tube - Flattening test (ISO 8492:2013)

This International Standard specifies a method for determining the ability of metallic tubes of circular crosssection to undergo plastic deformation by flattening. It may also be used to reveal the defects in the tubes. This International Standard is applicable to tubes having an outside diameter no greater than 600 mm and a thickness no greater than 15 % of the outside diameter. The range of the outside diameter or thickness, for which this International Standard is applicable, may be more exactly specified in the relevant product standard.

Metallic materials - Tube - Ring-expanding test (ISO 8495:2013)

This International Standard specifies a method for a ring-expanding test on tubes, that is used to reveal defects both on the surfaces and within the tube wall by expanding the test piece using a conical mandrel until fracture occurs. It may be also used to assess the ability of tubes to undergo plastic deformation. The ring-expanding test is applicable to tubes having an outside diameter from 18 mm up to and including 150 mm and a wall thickness from 2 mm up to and including 16 mm.

Puidutöötlemismasinate ohutus. Ketassaagmasinad. Osa 12: Pendelsaagmasinad

Safety of woodworking machines - Circular sawing machines - Part 12: Pendulum cross-cut sawing machines

This European Standard deals with all significant hazards, hazardous situations and events as listed in Clause 4 which are relevant to pendulum cross-cut sawing, herein after referred to as 'machines', designed to cut solid wood, chipboard, fibreboard, plywood and also these materials when covered with plastic edging and/or plastic/light alloy laminates when they are used as intended and under the conditions foreseen by the manufacturer including reasonably foreseeable misuse. This European Standard does not apply to: a) machines for cross cutting logs; b) machines where the saw unit can be rotated about a horizontal axis. NOTE The requirements of this European Standard apply to all machines whatever their method of control e.g. electromechanical and/or electronic. This European Standard is primarily directed at machines which are manufactured after the date of its publication as EN.

Safety of woodworking machines - Circular sawing machines - Part 19: Circular saw benches (with and without sliding table) and building site saws

This European Standard deals with all significant hazards, hazardous situations and events as listed in Clause 4 which are relevant to stationary and displaceable circular saw benches (with or without sliding table and/or demountable power feed unit) and building site saws, hereinafter referred to as "machines", designed to cut solid wood, chipboard, fibreboard, plywood and also these materials, if they are covered with plastic edging and/or plastic/light alloy laminates, when they are used as intended and under the conditions foreseen by the manufacturer including reasonably foreseeable misuse. Machines which are designed

to cut wood-based material may also be used for cutting hardened plastic materials with similar physical characteristics as wood. NOTE 1 For the definition of stationary and displaceable machine see 3.2.9 and 3.2.10. NOTE 2 Circular saw benches are used for ripping, cross cutting, dimensioning and grooving. Building site saws are used for ripping, cross cutting and dimensioning. The requirements of this document apply also to machines designed for grooving with a width not exceeding 20 mm in one pass by using a milling tool. This document does not apply to: a) machines set up on a bench or a table similar to a bench, which are intended to carry out work in a stationary position, capable of being lifted by one person by hand. The bench can also be an integrated part of the machine if it consists of hinged legs which can be extended down; b) hand held woodworking machines including any adaptation permitting their use in a different mode, i.e. bench mounting. NOTE 3 Transportable motor-operated electric tools are covered by the requirements of EN 61029-1:2009 together with EN 61029-2-1:2012; a hand-held motor-operated electric tool and a saw bench to form an integrated whole are covered by EN 60745-1:2009 together with EN 60745-2-5: 2010. For the purpose of this document, building site saws having a tiltable spindle are considered to be circular saw benches. This document is not applicable to circular saw benches (with and without sliding table) and building site saws which are manufactured before the date of its publication as EN. NOTE 4 Machines covered by this document are listed under 1.1 of Annex IV of the Machinery Directive.

CEN/TS 16498:2013

Paints and varnishes - Coating materials and coating systems for exterior wood - Assessment of tannin staining

This Technical Specification specifies a test method for assessing the discolouration of coatings on wood by tannin staining due to wood extractives. The method uses an extract from Merbau wood as an indicator. Bleeding of wood extractives is assessed at two specified stages firstly after coating application and secondly after cyclic climate exposure. A qualification of colour differences that can be attributed to three different causes, bleeding of extractives, low opacity of the coating film or general yellowing in climate exposure, is included. This document does not specify acceptance values for colour differences that can be tolerated and it is not applicable to staining caused by knots for which there is a different test method (e. g. CEN/TS 16359).

Keel: en

Alusdokumendid: CEN/TS 16498:2013

CEN/TS 16499:2013

Paints and varnishes - Coating materials and coating systems for exterior wood - Resistance to blocking of paints and varnishes on wood

This Technical Specification specifies a test method for determining, under standard conditions, whether a single-coat film or a multi-coat system of paints and varnishes on wood after a specified drying period is sufficiently dry to avoid damage when two painted surfaces or one painted surface and another surface are placed in contact under pressure and subsequently separated. The method is intended to simulate the conditions when painted articles come into contact with each other. In comparison to EN ISO 9117 2, the conditioning and parameters which influences the behaviour of wood coatings are more specific. NOTE In some countries, the test is called a "block or blocking resistance" test.

EVS-EN 50050-1:2013

Electrostatic hand-held spraying equipment - Safety requirements -- Part 1: Hand-held spraying equipment for ignitable liquid coating materials

1.1 This European Standard specifies the requirements for hand-held or hand-operated electrostatic spraying equipment for ignitable liquid coating materials to be used in explosive atmospheres generated by their own spray cloud within a temperature range from 5 °C to 40 °C. This European Standard deals with all hazards significant for the electrostatic spraying of liquid coating materials, which could also contain small quantities of added metal particles, if the work is carried out under conditions recommended by the manufacturer. In particular, this includes ignition hazards resulting from the generated explosive atmosphere. This European Standard specifies the design-related and test requirements for electrostatic spraying equipment of type A-L according to Table 1 of EN 50176:2009. 1.2 With regard to explosion protection and prevention measures, this European Standard also applies to ionisators with high voltage corona charging. Ionisators in conformity with EN 50050-1 provide equipment category 2G. Parts of ionisators, which are intended to be used or installed in Zone 2, provide equipment category 3G in conformity with EN 50050-1, see Annex D. 1.3 Electrostatic applicators are considered to be equipment of group II, category 2G for use in potentially explosive areas of zone 1 or 2, which have been generated by the equipment itself. All other parts of hand-held electrostatic spraying equipment are considered to be equipment of category 3G if they are installed or used in potentially explosive areas of zone 2. 1.4 All other significant hazards relevant for applicators (e.g. ejection of fluids, mechanical strength, electrical hazards (apart from the electrostatic hazards), noise, explosion, contact with or inhalation of dangerous substances, ergonomics) are covered by EN 1953. 1.5 This European Standard also gives details regarding quality assurance systems for electrostatic spraying equipment, see Annex C. 1.6 Additional requirements may be applicable to equipment designed for use in food and pharmaceutical industry. 1.7 This European Standard does not apply to zone classification of the areas in and around spray booths [see EN 12215], zone classification of other areas with potentially explosive atmosphere [see EN 60079-10-1], selection, erection and application of other electrical and non-electrical equipment in areas with explosion hazard [see EN 60079 14 and EN 12215], cleaning of spraying areas, see instruction manual of the spraying equipment, fire prevention and protection, for instance fire hazards due to other sources [see EN 12215], requirements for machinery for the supply and recirculation of coating material under pressure [see EN 12621]. 1.8 When processing coating materials having specific electrical properties (conductivity, resistivity) the function of the hand-held spraying equipment to charge coating materials electrostatically may be affected as a result of a voltage drop at the charging electrode.

EVS-EN 50050-2:2013

Electrostatic hand-held spraying equipment - Safety requirements -- Part 2: Hand-held spraying equipment for ignitable coating powder

1.1 This European Standard specifies the requirements for hand-held or hand-operated electrostatic spraying equipment for ignitable coating powders within a temperature range from 5 °C to 40 °C to be used in explosive atmospheres generated by their own spray cloud. This European Standard deals with all electrical hazards significant for the electrostatic spraying of coating powders, which could also contain small quantities of added metal particles, if the work is carried out under conditions recommended by the manufacturer. In particular, this includes ignition hazards resulting from the generated explosive atmosphere. This European Standard specifies the design-related and test requirements for electrostatic spraying equipment of type A-P according to Table 1 of EN 50177:2009. 1.2 With regard to explosion protection and prevention measures, this standard also applies to ionisators with corona charging. Ionisators used together with or under similar conditions as electrostatic spraying equipment for ignitable coating powders are considered to be equipment of group II, category 2D for use in potentially explosive areas of zone 21 or 22. All other parts of ionisators are considered to be equipment of category 3D if they are installed or used in potentially explosive areas of zone 22. 1.3 Electrostatic applicators are considered to be equipment of group II, category 2D for use in potentially explosive areas of zone 21 or 22, which have been generated by the equipment itself. All other parts of hand-held electrostatic spraying equipment are considered to be equipment of category 3D if they are installed or used in potentially explosive areas of zone 22, see Annex D. 1.4 All other significant hazards relevant for applicators (e.g. ejection of powder, mechanical strength, electrical hazards (apart from the electrostatic hazards)), noise, explosion, contract with or inhalation of dangerous substances, ergonomics) are covered by EN 1953. 1.5 This European Standard also gives details regarding quality assurance systems for electrostatic spraying equipment, see Annex C. 1.6 Additional requirements may be applicable to equipment designed for use in food and pharmaceutical industry. 1.7 This European Standard does not apply to zone classification of the areas in and around spray booths [see EN 12981], zone classification of other areas with potentially explosive atmosphere [see EN 60079-10-2], selection, erection and application of other electrical and non-electrical equipment in areas with explosion hazard [see EN 60079 14 and EN 12981], cleaning of spraying areas, see instruction manual of the spraying equipment, fire prevention and protection, for instance fire hazards due to other sources [see EN 12981], dust hazards [see EN 12981].

Electrostatic hand-held spraying equipment - Safety requirements -- Part 3: Hand-held spraying equipment for ignitable flock

1.1 This European Standard specifies the requirements for hand-held or hand-operated electrostatic spraying equipment for ignitable flock within a temperature range from 5 °C to 40 °C to be used in explosive atmospheres generated by their own spray

cloud. This European Standard deals with all electrical hazards significant for the electrostatic spraying of flock, which could also contain small quantities of added metal particles, if the work is carried out under conditions recommended by the manufacturer. In particular, this includes ignition hazards resulting from the generated explosive atmosphere. This European Standard specifies the design-related and test requirements for electrostatic spraying equipment of type A-F and type B-F according to Table 1 of EN 50223:2010. 1.2 Electrostatic applicators are considered to be equipment of group II, category 3D for use in potentially explosive areas of zone 22. All other parts of hand-held electrostatic spraying equipment are considered to be equipment of category 3D if they are installed or used in potentially explosive areas of zone 22. NOTE 1 Solvent vapours which could be evaporated by workpieces coated with adhesives do not lead to a zone 2 in the flocking area. 1.3 In addition to the requirements above, the requirements of EN 1953 applies with regard to all other significant hazards relevant for applicators (e.g. health hazards, inadequate ergonomics). 1.4 This European Standard does not apply to □ zone classification of the areas in and around spray booths [see EN 50223], □ zone classification of other areas with potentially explosive atmosphere [see EN 60079-10-2], □ selection, erection and application of other electrical and non-electrical equipment in areas with explosion hazard [see EN 60079-14 and EN 50223], □ cleaning of spraying areas, see instruction manual of the spraying equipment, □ fire prevention and protection, for instance fire hazards due to other sources [see EN 50223], □ explosion protection systems [see EN 50223], □ dust hazards [see EN 12981]. NOTE 2 Noise is not considered to be a significant hazard for hand-held spraying equipment for ignitable flock.

Chimneys - System chimneys with plastic flue liners - Requirements and test methods

This European Standard specifies the performance requirements and test methods for system chimneys with plastic flue liners used to convey the products of combustion from appliances to the outside atmosphere under dry and wet conditions. It also specifies the requirements for marking, manufacturer's instructions and evaluation of conformity. This European Standard describes chimney components from which system chimneys can be assembled. This European Standard is not applicable to chimneys with sootfire resistance classification class G. This European Standard is not applicable for chimneys with the following classification: - corrosion resistance class 2 concerning natural wood); - corrosion resistance class 3; - pressure class N2. This European Standard is applicable to chimneys designed so that no condensate accumulation can occur, e.g. with a minimum inclination of 3° to the horizontal. This European Standard is not applicable - for system chimneys with plastic coated flue liners; - to structurally independent (free-standing or self-supporting) chimneys. Chimneys with components which need further processing during the installation to reach the final material properties are no system chimneys and therefore also not covered by this standard. This European Standard does not cover the requirements for horizontal terminals (as defined for C1 installation types in CEN/TR 1749) regarding aerodynamic behaviour, rainwater ingress and icing behaviour.

Madalpingelised elektripaigaldised. Osa 5-56: Elektriseadmete valik ja paigaldamine.

Turvasüsteemid

Low-voltage electrical installations -- Part 5-56: Selection and erection of electrical equipment - Safety services

See HD 60364 osa käsitleb üldnõudeid turvasüsteemidele, turvasüsteemide elektrivarustuspaigaldiste valikule ja ehitamisele ning elektrilistele turvatoiteallikatele. Varu-elektrivarustussüsteemid ei kuulu selle osa käsitlusalaasse. See osa ei kehti plahvatusohtlike alade (BE3) paigaldiste kohta, millele esitatavad nõuded on toodud standardis EN 60079-14.

EVS 875-10:2013

Vara hindamine. Osa 10: Andmete kogumine ja analüüs, vara ülevaatus

Property valuation - Part 10: Data collection and analysis, property inspection

Standardisari EVS 875 käsitleb vara hindamist. Standardite kasutusalaks on vara hindamise ja hinnangute kasutamisega seotud tegevused. Standardite kasutajateks on vara hindajad, kinnisvara-, ehitus- ja keskkonnaspetsialistid, finantsaruandlusega tegelevad spetsialistid (raamatupidajad, audiitorid), krediidiasutused, kõrgemad õppeasutused. Standardisari loob aluse vara hindamise ühtsele käsitlusele, rahuldades nii era- kui ka avaliku sektori vajadusi. See standard käsitleb andmete kogumist hindamistoimingu käigus ja vara ülevaatust kui selle üht tähtsaimat osa, samuti vara analüüsi.

Lahtise põlemiskambriga autonoomsed gaaskütteleadmed

Open fronted gas-fired independent space heaters

This European Standard specifies the requirements and test methods for the construction, safety, marking and rational use of energy of open fronted gas-fired independent space heaters with and without a fan to assist with the transportation of flue gases, hereafter referred to as appliances. Although the fan may be mounted outdoors, this standard only covers appliances where the body of the appliance is indoors. This standard applies to types B11AS, B11BS, B14AS, and B14BS (commonly referred to in this standard as type B1 appliances) open fronted gas-fired independent space heating appliances: - that incorporate an atmospheric burner; - that are connected directly to an open flue (see Figure 1), or to a device to evacuate the products of combustion (open-flued appliances); - that have a nominal heat input not exceeding 20 kW (based on the net calorific value); - that are delivered with the gas-carrying components, burner(s), combustion chamber and heat exchanger fully assembled. It does not apply to: - closed-fronted appliances; - decorative fuel effect appliances as specified in EN 509; - catalytic combustion appliances; - ducted-air appliances; - appliances installed by means of a closure plate (see 3.3.3.3).

Household and similar electrical appliances - Safety - Particular requirements for commercial electric spin extractors

This Clause of Part 1 is replaced by the following: This European Standard deals with the safety of electrical operated spin extractors intended to be used by trained users in i.e. hotels, hospitals, factories, in light industry and on farms. It also covers spin extractors which are declared for commercial use in public areas and operated by lay persons e.g. in laundrettes, communal laundry rooms. Their rated voltage being not more than 250 V for single phase and 480 V for others. This standard deals with the common hazards presented by spin extractors that are encountered by all persons. However, in general, it does not take into account: a) persons (including children) whose: 1) physical, sensory or mental capabilities, or 2) lack of experience and knowledge, prevents them from using the spin extractors safely without supervision or instruction, b) children playing with the spin extractors. Attention is drawn to the fact that: – for commercial electric spin extractors intended to be used in vehicles or on board ships or aircraft, additional requirements might be necessary, – in many countries additional requirements are specified by the national health authorities, the national authorities responsible for the protection of labour, the national water supply authorities and similar authorities. This standard does not apply to: – industrial laundry machinery (EN ISO 10472-2), – spin extractors intended to be used in locations where special conditions prevail, such as the presence of a corrosive or explosive atmosphere (dust, vapour or gas). For the purpose of this standard, the term "appliance" as used in Part 1 is to be read as "Spin extractors intended for commercial use".

Household and similar electrical appliances - Safety - Particular requirements for commercial electric tumble dryers

This European Standard deals with the safety of electrical operated tumble dryers intended to be used by trained users in i.e. hotels, hospitals, factories, in light industry and on farms. It also covers tumble dryers which are declared for commercial use in public areas and operated by lay persons e.g. in laundrettes, communal laundry rooms. The rated voltage shall not be more than 250 V for single phase and 480 V for others. This standard also deals with the safety of tumble dryers that use a refrigerating system, incorporating sealed motor-compressors, for drying textile material. These machines may use flammable refrigerants. Additional requirements for these machines are given in Annex BB. This standard also covers tumble dryers making use of other energy sources. It does not cover requirements for these other energy sources. However the influence of these other energy sources on the machines is covered. This standard deals with the common hazards presented by tumble dryers that are encountered by all persons. However, in general, it does not take into account: a) persons (including children) whose: 1) physical, sensory or mental capabilities, or 2) lack of experience and knowledge prevents them from using the tumble dryers safely without supervision or instruction; b) children playing with the tumble dryer. Attention is drawn to the fact that: – for commercial electric tumble dryers intended to be used in vehicles or on board ships or aircraft, additional requirements may be necessary; – in many countries, additional requirements are specified by the national health authorities, the national authorities responsible for the protection of labour, the national water supply authorities, the national authorities responsible for transportation and the national authorities for buildings. This standard does not apply to: – industrial laundry machinery (EN ISO 10472-4), – tumble dryers intended to be used in locations where special conditions prevail, such as the presence of a corrosive or explosive atmosphere (dust, vapour or gas).

Household and similar electrical appliances - Safety - Particular requirements for commercial electric washing machines

This clause of Part 1 is replaced by the following: This European Standard deals with the safety of electrical operated washing machines intended to be used by trained users in e.g. hotels, hospitals, factories, in light industry and on farms. It also covers washing machines declared for commercial use in public areas and operated by lay persons e.g. in laundrettes, communal laundry rooms. Their rated voltage being not more than 250 V for single phase and 480 V for others. This standard also covers washing machines making use of other energy sources. It does not cover requirements for these other energy sources or compressed air. However the influence of these other energy sources on the machines is covered. These washing machines are designed to be connected to hot and/or cold water supply. Washing machines making use of steam or hot water for heating purposes are also within the scope of this standard. This standard deals with the common hazards presented by washing machines that are encountered by all persons. However, in general, it does not take into account: a) persons (including children) whose: 1) physical, sensory or mental capabilities, or 2) lack of experience and knowledge, prevents them from using the washing machine safely without supervision or instruction; b) children playing with the washing machine. Attention is drawn to the fact that: – for commercial electric washing machines intended to be used in vehicles or on board ships or aircraft, additional requirements may be necessary, – in many countries additional requirements are specified by the national health authorities, the national authorities responsible for the protection of labour, the national water supply authorities and similar authorities, – for commercial electric washing machines having a drying function, EN 50570 (commercial electric tumble dryers) is also applicable. This standard does not apply to: – industrial laundry machinery (EN ISO 10472-2), – washing machines intended to be used in locations where special conditions prevail, such as the presence of a corrosive or explosive atmosphere (dust, vapour or gas). For the purpose of this standard, the term “appliance” is to be read as “washing machine intended for commercial use”.

STANDARDIKAVANDITE ARVAMUSKÜSITLUS

Eesmärgiga tagada standardite vastuvõtmine, järgides konsensuse põhimõtteid, peab standardite vastuvõtmisele eelnema standardikavandite avalik arvamusküsitlus, milleks ettenähtud perioodi jooksul (reeglina 2 kuud) on asjast huvitatuid võimalik tutvuda standardikavanditega, esitada kommentaare ning teha ettepanekuid parandusteks. Eriti oodatud teave kui rahvusvahelist või Euroopa standardikavandit ei peaks vastu võtma Eesti standardiks (vastuolu Eesti õigusaktidega, pole Eestis rakendatav jt põhjustel)

Arvamusküsitlusele on esitatud:

1. Euroopa ja rahvusvahelised standardikavandid, mis on kavas vastu võtta Eesti standarditeks jõustumistete või ümbertrüki meetodil.
2. Eesti algupärased standardikavandid.

Arvamusküsitlusel olevate dokumentide loetelus on esitatud järgnev informatsioon standardikavandite kohta:

- Tähis
- Euroopa või rahvusvahelise alusdokumendi tähis, selle olemasolul
- Arvamuste esitamise tähtaeg
- Pealkiri
- Käsitusala
- Keelsus (en=inglise; et=eesti)
- Asendusseos, selle olemasolul

Kavanditega tutvumiseks palume saata vastav teade aadressile standardiosakond@evs.ee, kavandeid saab osta klienditeenindusest standard@evs.ee.

Construction products - Assessment of release of dangerous substances - Terminology

This standard defines terms used in the field of the assessment of release of dangerous substances for construction products. The terms are classified under the following main headings: - Terms regarding the development and application of technical specifications for construction products; - Terms related to products and their ingredients (general; soil, ground- and surface water; indoor air); - Terms related to sampling, test procedures and declaration of test results (general; soil, ground- and surface water; indoor air); - Terms related to radiation. An alphabetical index is provided.

Live working - Footwear for electrical protection - Insulating footwear and overboots

This European standard specify the requirements and testing for PPE footwear used as electrical insulating footwear and overboots used for working live or close to live parts on installations up to 36,000V ac. The products designed and manufactured according to this standard contribute to the safety of the users provided they are used by skilled persons, in accordance with safe methods of work and the instructions for use. Antistatic, shock resistant and conductive footwear are not covered by this standard.

prEN 15528

Railway applications - Line categories for managing the interface between load limits of vehicles and infrastructure

This European Standard describes methods of classification of existing and new railway lines and the categorisation of vehicles. The standard specifies the technical requirements for ensuring the compatibility of the interface between a vehicle and infrastructure with respect to the vertical load carrying capacity of a line. The standard is suitable for use on freight, passenger and mixed traffic lines with standard track gauge and wider than standard track gauge and contains requirements relevant to: - classification of the vertical load carrying capacity of railway infrastructure; - design of railway vehicles; - determination of payload limits of freight wagons. A summary of the classification of infrastructure and the categorisation of vehicles is given in Annex B. The assessment of the vertical load carrying capacity of civil engineering structures, track, sub-grade and earthworks by the use of the load models defined in Annex A permits the classification of infrastructure into line categories. This European Standard identifies on which lines vehicles are compatible to the infrastructure for regular traffic regarding vertical load effects. Line categories are provided for: - all traffic types; - heavy freight traffic; - locomotives; - multiple units; - lightweight passenger traffic. Narrow track gauge lines are outside the scope of this standard. Mobile railway infrastructure construction and maintenance equipment (e.g. rail mounted plant, cranes) in working mode and portable trolleys as defined by EN 13977 are outside the scope of this European Standard. This European Standard does not cover the system used in Great Britain, where

all lines and vehicles are to be classified in accordance with the RA (Route Availability) System. A guide to the equivalent categories in accordance with this European Standard is given in Annex Q. This European Standard does not cover requirements relating to the maximum total mass or maximum length of a train. The requirements of this European Standard do not replace regulations relating to, for example dynamic wheel/rail contact force limits, running behaviour and vehicle ride considerations, vehicle structural design limitations etc. Publication of line categories is outside the scope of this European Standard.

11 TERVISEHOOLDUS

prEN 16442

Controlled environment storage cabinet for disinfected thermolabile endoscopes

The proposed standard specifies the performance requirements applying to cabinets designed to store and dry heat-sensitive endoscopes (SCHE) following automated or manual reprocessing. The storage cabinets are designed to provide a controlled environment for storage of endoscope(s) and when necessary drying of the endoscope(s), including the endoscope(s) channels. The controlled environment is provided to ensure that during storage there is no deterioration of the microbial quality of the endoscope. The drying stage is intended to supplement, if necessary, any drying provided as part of the automated or manual reprocessing cycle. The cabinet is not intended to provide any cleaning or disinfection function. Note 1 The use of a storage cabinet may allow the safe use of the endoscope for an extended period from the time of reprocessing and improve availability for emergency use. Note 2 Thorough drying of an endoscope in a washer-disinfector may require a prolonged cycle time; the use of a drying-storage cabinet may enhance throughput of the endoscopes.

Wind turbines - Protective measures - Requirements for design, operation and maintenance

This European Standard specifies requirements for protective measures relating to health and safety of persons, domestic animals and property, to be incorporated into the design, operation and maintenance of wind turbines. The requirements cover the potential danger zones inside and in the environment of a wind turbine where persons, domestic animals and property may be exposed to hazards from the wind turbine. This standard covers the safety issues of the wind turbine itself and the directly related material, equipment and processes essential for the safe operation of the complete system. This also includes switchgear outside the tower, internal grid, grid connection, and any means of access. This European Standard does not cover the structural design of the wind turbine. This European Standard is not applicable to wind turbines manufactured before the date of its publication by CENELEC.

FprEN 54-3

Fire detection and fire alarm systems - Part 3: Fire alarm devices - Sounders

This European Standard specifies the requirements, test methods and performance criteria for fire alarm sounders, including voice sounders, in a fixed installation intended to signal an audible warning between the fire detection and fire alarm systems and the occupants of a building (see EN 54-1:2011). This European standard provides for the assessment and verification of constancy of performance (AVCP) of fire alarm sounders to this EN. This European standard is not intended to cover: a) loudspeaker type devices primarily intended for emitting emergency voice messages that are generated from an external audio source; b) supervisory sounders, for example, within the control and indicating equipment.

Protective clothing for firefighters - Requirements and test methods for fire hoods for firefighters

This standard specifies minimum safety requirements and test methods for a firehood to be worn during firefighting operations and associated activities. This standard only applies in situations when protective clothing (EN 469), breathing apparatus (EN 136 and EN 137), and helmet (EN 443) are also worn.

Protective clothing to be worn by firefighters during technical rescue operations

This European Standard specifies minimum levels of performance requirements for protective clothing to be worn by firefighters during technical rescue operations. This European Standard covers the general clothing design, the minimum performance levels of the materials used, the methods of test to be used to determine these performance levels, and marking and information supplied by the manufacturer. The required performance levels may be achieved by the use of one or more garments. The levels of thermal and other protection specified by this standard may not be sufficient to provide the type and levels of protection required for certain risks encountered fighting fires in buildings and other structures, rescue from fire in buildings and other structures, dealing with hazardous chemicals etc. This European Standard does not cover protection for the head, hands and feet or protection against other hazards e.g. biological, radiological and electrical hazards. These aspects may be covered in other European Standards.

Water quality - Determination of polycyclic aromatic hydrocarbons (PAH) in whole water samples using liquid solid extraction combined with gas chromatography mass spectrometry (GC-MS)

Development of a method for the quantitative determination of PAHs in whole water samples using GC-MS. The following individual PAHs are considered: This analytical method specifies the determination of PAHs meeting the following requirements:
- The analysis of whole water samples containing up to 0,5 g/L of suspended solids; - The limit of quantification (LOQ) shall be equal or less than 30 % of the EQS; - The measurement uncertainty shall be equal or less than 50 %; - The methods shall be fully in-house validated and tested for ruggedness prior to interlaboratory validation; - A European interlaboratory comparison study will be conducted according to ISO 5725.

Electric cables - Fire resistance test for unprotected electric cables (P classification)

This European Standard specifies a test method to evaluate the maintenance of circuit integrity of electric cables which have intrinsic resistance to fire under fire conditions, in order to classify the electric cable according to EN 13501-3 [2]. The test determines the survival time for circuit integrity of the electric cable when exposed to fire under the conditions of the standard time/temperature curve. This European Standard is used in conjunction with EN 1363-1. This European Standard applies to cables of rated voltages up to and including 600/1 000 V and control cables with rated voltage. The cable is tested in a standardized installation condition. The test does not assess the performance of the cable management system.

Wind turbines - Protective measures - Requirements for design, operation and maintenance

This European Standard specifies requirements for protective measures relating to health and safety of persons, domestic animals and property, to be incorporated into the design, operation and maintenance of wind turbines. The requirements cover the potential danger zones inside and in the environment of a wind turbine where persons, domestic animals and property may be exposed to hazards from the wind turbine. This standard covers the safety issues of the wind turbine itself and the directly related material, equipment and processes essential for the safe operation of the complete system. This also includes switchgear outside the tower, internal grid, grid connection, and any means of access. This European Standard does not cover the structural design of the wind turbine. This European Standard is not applicable to wind turbines manufactured before the date of its publication by CENELEC.

Energy efficiency of transformers with Um greater than 36 kV

This European Standard applies to new three-phase and single-phase power transformers with $U_m > 36 \text{ kV}$. The scope of this European Standard is the following:

- Defining the appropriate energy efficiency criteria;
- Setting of benchmark minimum efficiency levels for new transformers based on an assessment of the energy efficiency of the European transformer population installed in the last 10 years;
- Proposing higher minimum efficiency levels for improving the energy efficiency of new

transformers; • Providing guidance for consideration of Total Cost of Ownership. This European Standard provides also a form for efficiency data collection to inform future efficiency benchmark levels. Transformers considered to be out of the scope of this document are the following: • Instrument transformers; • Earthing transformers; • Traction transformers on rolling stock; • Starting transformers; • Testing transformers; • Welding transformers; • Explosion-proof and underground mining transformers; • Transformers for deep water (submerged) applications.

Infotehnoloogia. Turbemeetodid. Infoturvariski haldus

Information technology -- Security techniques -- Information security risk management

See standard annab suuniseid infoturvariski halduseks. Standard toetab ISO/IEC 27001 spetsifitseeritud üldkontseptsioone ja on kavandatud aitama rahulda vält rakendada infoturvet riskihaldusliku lähenemisviisi alusel. Selle standardi täielikuks mõistmiseks on tähtis tunda mõisteid, mudeleid, protsesse ja termineid, mida kirjeldavad ISO/IEC 27001 ja ISO/IEC 27002. Standardit saab rakendada igat tüüpi organisatsionidele (näiteks äriettevõtetele, riigiasutustele, mitteturulunduslikele organisatsionidele), kes kavatsevad hallata riske, mis võivad rikkuda organisatsiooni teabe turvalisust.

prEN 15528

Railway applications - Line categories for managing the interface between load limits of vehicles and infrastructure

This European Standard describes methods of classification of existing and new railway lines and the categorisation of vehicles. The standard specifies the technical requirements for ensuring the compatibility of the interface between a vehicle and infrastructure with respect to the vertical load carrying capacity of a line. The standard is suitable for use on freight, passenger and mixed traffic lines with standard track gauge and wider than standard track gauge and contains requirements relevant to: - classification of the vertical load carrying capacity of railway infrastructure; - design of railway vehicles; - determination of payload limits of freight wagons. A summary of the classification of infrastructure and the categorisation of vehicles is given in Annex B. The assessment of the vertical load carrying capacity of civil engineering structures, track, sub-grade and earthworks by the use of the load models defined in Annex A permits the classification of infrastructure into line categories. This European Standard identifies on which lines vehicles are compatible to the infrastructure for regular traffic regarding vertical load effects. Line categories are provided for: - all traffic types; - heavy freight traffic; - locomotives; - multiple units; - lightweight passenger traffic. Narrow track gauge lines are outside the scope of this standard. Mobile railway infrastructure construction and maintenance equipment (e.g. rail mounted plant, cranes) in working mode and portable trolleys as defined by EN 13977 are outside the scope of this European Standard. This European Standard does not cover the system used in Great Britain, where all lines and vehicles are to be classified in accordance with the RA (Route Availability) System. A guide to the equivalent categories in accordance with this European Standard is given in Annex Q. This European Standard does not cover requirements relating to the maximum total mass or maximum length of a train. The requirements of this European Standard do not replace regulations relating to, for example dynamic wheel/rail contact force limits, running behaviour and vehicle ride considerations, vehicle structural design limitations etc. Publication of line categories is outside the scope of this European Standard.

Nafta ja vedelad naftatooted. Mõõtemahutites sisalduva vedelikukoguse käsitsi mõõtmine ja mõõtemääramatuse hindamine

Petroleum and liquid petroleum products. Measurement of content of storage tanks by manual methods and calculation of measurement uncertainty

Käesolevas Eesti standardis antakse juhised nafta ja vedelate naftatoodete (edaspidi vedelike) ja naftatootega võrdsustatavate muude vedelate kütteainete standardtingimustele vastava mahu ja massi arvutamiseks. Standard kirjeldab atmosfäärirööhi all olevate vertikaalsetes statsionaarsetes silindrilistes mahutites sisalduva vedeliku: - sügavuse käsitsi mõõtmist ujuva katusega või ilma ujuva katusega mahutites; - vaba vee sügavuse käsitsi mõõtmist; - baaskõrguse käsitsi mõõtmist, - vedeliku temperatuuri käsitsi mõõtmist, - vedeliku mahu ja massi arvutamist mõõte- ja standardtingimustel, - vedeliku koguse mõõtemääramatuse hindamist. Standard on rakendatav järgmistel tingimustel: - vedelike tihedus peab olema piirides 610,6 kg/m³ kuni 1163,5 kg/m³; - vedelike temperatuur mõõtmiste ajal on -25°C kuni +100°C; - vedeliku minimaalne mõõdetav sügavus või vedeliku ülekande puhul sügavuste minimaalne erinevus enne ja peale teingu sooritamist on 500 mm; - mahutite kalibreerimistabelid peavad olema koostatud vastavalt EVS-ISO 7507-1 või EVS-ISO 12917 nõuetele; - mahuti kalle ei ületa 3 % vastavalt OIML R71 nõuetele; - mahutis sisalduva vedeliku ja mahutabeli arvutusel aluseks olnud tiheduste väärtsused ei tohi erineda rohkem, kui ± 30%. Märkus: Käesolev standard ei sisalda vedelkütuste käitlemisel rakendataaid ohutusnõudeid

Paints and varnishes - Determination of release rate of biocides from antifouling paints - Part 6: Determination of tralopyril release rate by quantitation of its degradation product in the extract (ISO 15181-6:2012)

ISO 15181-6:2012 specifies a method for determining the amount of tralopyril that has been released from an antifouling paint into artificial seawater in accordance with the procedure given in ISO 15181-1. Tralopyril is unstable in water and degrades hydrolytically to form 3-bromo-5-(4-chlorophenyl)-4-cyano-1H-pyrrole-2-carboxylic acid (BCCPCA). ISO 15181-6:2012 specifies a method for accelerating the conversion of the released tralopyril into this degradation product by heat treatment and quantifying the concentration of the BCCPCA degradation product in the artificial seawater extract, and gives the final calculation for the release rate of tralopyril under the specified laboratory conditions. ISO 15181-6:2012 is designed to allow the concurrent determination of tralopyril and other biocides that can be released by a given antifouling paint (for example, zineb) through the analysis of separate sub-samples of an artificial seawater extract generated in accordance with ISO 15181-1. When used in conjunction with ISO 15181-1, the practical limits for quantifying release rates by this method are from 0,36 µg cm⁻² d⁻¹ to 270 µg cm⁻² d⁻¹. The quantitation of release rates lower than this range requires the use of an analytical method with a limit of quantitation for tralopyril in artificial seawater of less than 2 µg/l.

prEN 12697-48

Bituminous mixtures - Test methods for hot mix asphalt - Part 48: Interlayer Bonding

This draft European Standard specifies test methods for determining the bond strength between an asphalt layer and other construction layers in road or airfield pavement. The tests can also be applied on laboratory prepared interlayers. Further informative test methods are defined for evaluating the complex bond stiffness between road construction layers. The normative tests described in this standard are □ Torque bond test (TBT), □ Shear bond test (SBT), □ Tensile Adhesion Test (TAT). Further two test methods for evaluating the complex bond stiffness are described in informative annexes: □ Compressed shear bond test (CSBT), □ Cyclic compressed shear bond test (CCSBT). NOTE The described test methods simulate different loading conditions and are applicable on different bonds between road construction layers: The torque bond test assesses the resistance to horizontal shear stress: □ The torque bond test is suitable for testing the bond strength between road layers in laboratory and in situ. □ The torque bond test assesses the resistance to the stresses generated primarily by traffic accelerating or braking, but also by thermal movements when the layers are of different materials (e.g. asphalt, microsurfacing or cement concrete) □ The torque bond test can be carried out immediately after laying. □ The torque bond test can be applied for assess the capability of bond coats or tack coats. □ When the thickness of the top layer above the interlayer assessed is less than 15 mm, the torque bond test can be applied for evaluating the durability of the top layer. The shear bond test assesses the resistance to horizontal shear stresses in the interlayer of two road construction layers. □ The shear bond test assesses the resistance to the stresses generated primarily by traffic accelerating or braking, but also by thermal movements when the layers are of different materials (e.g. asphalt, microsurfacing or cement concrete). □ The shear bond test can be applied for assess the capability of bond coats or tack coats. □ The shear bond test is suitable to evaluate the shear bond strength of construction layers with a thickness □ 20 mm. The tensile adhesion test assesses the tensile bond strength between two road construction layers. □ The test method is applicable on thin surface layers. The compressed shear bond test assesses shear behaviour of interlayers subjected to both horizontal and vertical traffic loads. The cyclic compressed shear bond tests assesses the interlayer bond stiffness at various temperatures, loading frequencies and normal stress levels.

General requirements for Home and Building Electronic Systems (HBES) and Building Automation and Control Systems (BACS) -- Part 11: Smart Metering - Application Specifications - Simple External Consumer Display

This European Standard specifies a data model to abstract the metering world towards a simple external consumer display. The data model, as described by means of functional blocks contained in this European Standard, lays down the format of metering data accessible by a simple external consumer display. This data interface would be typically part of the meter communication functions and be accessed by a simple external consumer display via the H1 interface of the TR 50572 between the display and the meter communication functions. The data interface specified in this document may also be accessed by the LNAP or NNAP through the C or M interface, after which the data could be accessed by HBES devices through the H2 and H3 interface. In other words, in this way the same data model can be used both on the H1 as well as the H2 and H3 interface. The document specifies neither the communication mechanisms used on the data interface, nor the applied data privacy and security mechanisms, where national regulations may apply. The document does also not specify the communication protocol used between the meters and the meter communication functions. However, it takes into account the existing European standards like the EN 13757 and the EN 62056 series for the definition of the data model.

Asfaltsegud. Kuuma asfaltsegu katsemeetodid. Osa 26: Jäikus

See Euroopa standard käsitleb asfaltsegude jäikuse iseloomustamise meetodeid alternatiivsete katsete abil, sealhulgas paindekatset ning otsesed ja kaudsed tömbekatset. Katsed viakse läbi tihendatud asfaltmaterjalidega sinusoidaalse või muu reguleeritud koormuse all, kasutades selleks erinevat tüpi proovikehi ja tugesid. Protseduuri kasutatakse asfaltsegude klassifitseerimisel jäikuse järgi, et viidata katte suhtelisele töövõimele, koguda andmeid konstruktsiooni käitumise kohta teel ja hinnata katsetulemusi vastavalt asfaltsegude spetsifikatsioonidele. Kuna see standard ei kohusta kasutama kindlat tüpi katseseadmostikku, sõltub katsetingimuste täpne valik kasutatava seadme võimalustest ja tööpiirkonnast. Spetsiifiliste katsetingimuste valikul tuleb respekteerida asfaltsegude tootestandardite nõudeid. Selle dokumendi rakendatavust kirjeldatakse asfaltsegude tootestandardites.

prEVS-ISO 11665-6

Radioaktiivsuse mõõtmine keskkonnas. Œhk: radoon-222. Osa 6: Aktiivsuskontsentratsiooni kohtmõõtmise meetodid

Standardi ISO 11665 selles osas kirjeldatakse radoon-222 pistelisi mõõtmismeetodeid. Selles antakse juhiseid radooni aktiivsuskontsentratsiooni kohtmõõtmiseks teatud asukohas mõne minuti jooksul nii avatud kui ka suletud atmosfääris. Käesolev mõõtmisviis on ette nähtud radooni aktiivsuskontsentratsiooni kiireks hindamiseks õhus. Tulemust ei ole võimalik ekstrapoleerida radooni aktiivsuskontsentratsiooni aastasele hinnangule. Selline mõõtmisviis ei ole seega kohaldatav aastase kiiruse hindamiseks. Kirjeldatud mõõtmismeetod on kohaldatav õhuproovide suhtes, mille radooni aktiivsuskontsentratsioon on suurem kui 50 Bq/m³. MÄRKUS Näiteks sobivat seadet kasutades on radooni aktiivsuskontsentratsiooni võimalik kohtmõõta maapinnas ja materjali ning atmosfääri kokkupuutepinnal (vt ka standard ISO 11665-7).

Infotehnoloogia. Turbemeetodid. Infoturvariski haldus

See standard annab suuniseid infoturvariski halduseks. Standard toetab ISO/IEC 27001 spetsifitseeritud üldkontseptsiione ja on kavandatud aitama rahulda valt rakendada infoturvet riskihaldusliku lähenemisviisi alusel. Selle standardi täielikuks mõõtmiseks on tähtis tunda mõisteid, mudeleid, protsesse ja termineid, mida kirjeldavad ISO/IEC 27001 ja ISO/IEC 27002. Standardit saab rakendada igat tüüpi organisatsioonidele (näiteks äriettevõtetele, riigiasutustele, mitteturulunduslikele organisatsioonidele), kes kavatsevad hallata riske, mis võivad rikkuda organisatsiooni teabe turvalisust.

STANDARDITE JA STANDARDILAADSETE DOKUMENTIDE ÜLEVAATUS

Algupärase Eesti standardi ülevaatus toimub üldjuhul iga viie aasta järel või aasta enne kehtivusaja lõppu ning selle eesmärk on kontrollida standardi tehnilist taset, vastavust aja nõuetele, vastavust kehtivatele õigusaktidele, kooskõla rahvusvaheliste või Euroopa standarditega jne.

Ülevaatusse tulemusena jäetakse standard kehtima, algatatakse standardi muudatuse või uustöötluse koostamine, tühistatakse standard või asendatakse see ülevõetava Euroopa või rahvusvahelise standardiga.

PIKENDAMISKÜSITLUS

EVS 892:2007

Hajusallikate heitkoguste mõõtmine. Põhimõtted **Determination of diffusive emissions by measurements – Basic concepts**

Selles standardis käsitletakse hajusallikate heitkoguste mõõtmise põhimõtteid ja meetodeid. Kuna hajusallikate puhul heitgaasi voog ei liigu torus, ei saa seda mõõta punktsaasteallikate heitkoguste määramise standardite alusel. Standardis kirjeldatud hajusallikate heitkoguste mõõtmine põhineb ainekoncentraatsioonide ja meteoroloogiliste parameetrite määramisel ning vajadusel arvutusmudelite kasutamisel. Mõõtmised hajusallikate juures tehakse saasteallika pinnalt või maapinnalähedases õhukihis.

TÜHISTAMISKÜSITLUS

Selles rubriigis avaldame teavet Euroopa standardimisorganisatsioonides algatatud Euroopa standardite tühistamisküsitluse kohta ja rahvusvahelise alusstandardiga Eesti standardite tühistamisküsitluse kohta. Küsitluse eesmärk on selgitada, kas alljärgnevalt nimetatud standardite jätkuv kehtimine Eesti ja/või Euroopa standardina on vajalik.

Allviidatud standardite kehtivana hoidmise vajalikkusest palume teavitada EVS-i standardiosakonda (standardiosakond@evs.ee).

EVS-EN 4618:2009

Aerospace series - Aircraft internal air quality standards, criteria and determination methods

This standard specifies requirements and determination methods for newly certificated commercial passenger aircraft programmes. This standard applies to newly certificated commercial passenger aircraft programmes. It may also apply to current production aircraft if it does not carry significant penalties, i.e. if it can be shown to be technically feasible and economically justifiable. This standard covers the period from first crew embarkation to last crew disembarkation.

Ergonomics of human-system interaction - Part 400: Principles and requirements for physical input devices

This part of ISO 9241 gives guidelines for physical input devices for interactive systems. It provides guidance based on ergonomic factors for the following input devices: keyboards, mice, pucks, joysticks, trackballs, trackpads, tablets and overlays, touch sensitive screens, styli, light pens, voice controlled devices, and gesture controlled devices. This part of ISO 9241 defines and formulates ergonomic principles valid for the design and use of input devices. These principles are to be used to generate recommendations for the design of products and for their use. This part of ISO 9241 defines relevant terms for the entire 400 series of ISO 9241. For some applications, e.g. in areas where safety is the major concern, other additional principles may apply and take precedence over the guidance given here.

UUED EESTIKEELSED STANDARDID JA STANDARDILAADSED DOKUMENDID

EVS 875-10:2013

Vara hindamine. Osa 10: Andmete kogumine ja analüüs, vara ülevaatus

Property valuation - Part 10: Data collection and analysis, property inspection

Standardisari EVS 875 käitleb vara hindamist. Standardite kasutusalaks on vara hindamise ja hinnangute kasutamisega seotud tegevused. Standardite kasutajateks on vara hindajad, kinnisvara-, ehitus- ja keskkonnaspetsialistid, finantsaruandlusega tegelevad spetsialistid (raamatupidajad, auditorid), kredidiasutused, kõrgemad õppesuusused. Standardisari loob aluse vara hindamise ühtsele käsitslusele, rahuldades nii era- kui ka avaliku sektori vajadusi. See standard käitleb andmete kogumist hindamistoimingu käigus ja vara ülevaatust kui selle üht tähtsaimat osa, samuti vara analüüs.

EVS 901-20:2013

Tee-ehitus. Katsemeetodid. Osa 20: Filtratsioonimooduli määramine

Road construction - Test methods - Part 20: Determination of permeability

Selles Eesti standardis määratakse tee- ja tsiviliehituslikeks töödes dreenkihi ja muldkeha materjalina kasutatavate peen- ja fraktsioneerimata täitematerjalide ning pinnaste filtratsioonimoodooli määramise katsemeetod. Materjali või pinnase algne terakoostis kirjeldatakse märgsõelumise tulemusena. Filtratsioonimoodoli katses kasutatakse eraldi välja sõelutud proove, mille vähim terasuurus $d = 0$ mm ja suurim terasuurus $D = 4$ mm. Proovid tihendatakse filtratsioonimooduli määramise katseseadmesse optimaalse veesisaldusega, mis on eelnevalt Proctor-teimiga määratud samale fraktsioonile (0/4).

EVS JUHEND 6:2013

Standardimisala tehnilise komitee ja projektkomitee asutamine ning töökord

Establishment and working procedures of a standardisation technical committee and project committee

Juhend kehtestab nõuded standardimisala tehnilise komitee ja projektkomitee asutamisele ja tegutsemisele, tegevuse peatamisele ja lõpetamisele.

EVS-EN 10027-1:2005

Teraste tähistussüsteem. Osa 1: Terase margitähised

Designation systems for steels - Part 1: Steel names

1.1 See Euroopa standard spetsifitseerib teraste tähistamise eeskirjad, kasutades rakenduste ja põhiliste, st mehaaniliste, füüsikaliste ja keemiliste omaduste väljendamiseks täht- ja arvtähiseid, mis moodustavad terast samastava lühendi. MÄRKUS Inglise keeles on terase tähistus selle Euroopa standardi mõistes tuntud kui „steel name“, prantsuse keeles kui „designation symbolique“ ja saksa keeles kui „Kurznamen“. 1.2 See Euroopa standard rakendub terastele, mis on spetsifitseeritud Euroopa standardites (EN), tehnilistes spetsifikatsioonides (TS), tehnilistes aruannetes (TR) ja CEN-i liikmete rahvuslikes standardites. 1.3 Neid reegleid võib rakendada ka standardimata terastele. 1.4 Teraste numbriline tähistussüsteem, mis on tuntud kui teraste tunnusnumbrid, on spetsifitseeritud standardis EN 10027-2.

EVS-EN 10130:2007

Külmvormitavad külmvaltsitud madalsüsinikerasest lehttooted. Tehnilised tarnetingimused

Cold rolled low carbon steel flat products for cold forming - Technical delivery conditions

See Euroopa standard kehtib külmvormitavate külmvaltsitud madalsüsinikerasest pindamata lehttoodeote puhul laiusega ≥ 600 mm ning paksusega minimaalselt $0,35$ mm ja ≤ 3 mm (kui päringu ja tellimuse käigus ei ole teisiti kokku lepitud), mida tarinatakse lehtedena, rullidena, ribastatud rullidena või ribastatud rullidest või lehtedest mõõtulõigatud materjalina. See standard ei kehti külmvaltsitud kitsale linterasele (valtsimislaiusega < 600 mm) ega ka külmvaltsitud lehttoodetele, millel on eraldi standard, täpsemalt: — orienteerimata kristallstruktuuriga elektrotehniline külmvaltsitud terasplekk ja ribateras (EN 10106); — elektrotehnilisest ribaterasest pooltooted (EN 10126 ja EN 10165); — rullides madalsüsinikerasest plekk (EN 10205); — külmvaltsitud kõrge voolavuspriira lehtteras külmvormimiseks (EN 10268); — külmvaltsitud madalsüsinikimitelegeerterasest kitsas ribateras külmvormimiseks (EN 10139); — külmvaltsitud madalsüsinikerasest emaileeritavad lehttooted (EN 10209).

EVS-EN 1342:2012

Looduskivist sillutuskivid välissillutiseks. Nõuded ja katsemeetodid

Setts of natural stone for external paving - Requirements and test methods

See Euroopa standard spetsifitseerib toimivusnõuded ja vastavad katsemeetodid kõigile välissillutistes ja teepiiretes kasutatavatele looduskivist sillutuskividele. Kasutamine välissillutistes hõlmab kõiki teedeehitusele tüüpilisi sillutisi, nagu jalakäigu- ja liikluslad, väljakud ja muud sarnased objektid vällistingimustes, millele möjuvad ilmastikutegurid, nagu temperatuurimuumutused, vihm, jäät, tuul jne. Seda Euroopa standardit on võimalik kasutada ka vastavuse hindamisel ja looduskivist sillutuskivide märgistamisel. See Euroopa standard hõlmab ka kaubanduse seisukohalt olulisi karakteristikuid.

EVS-EN 50110-1:2013

Elektripaigaldiste käit. Osa 1: Üldnõuded

Operation of electrical installations -- Part 1: General requirements

See Euroopa standard kehtib elektripaigaldiste käidul ja elektripaigaldistes, nende juures või lächedal sooritatavate kõigi töötoimingute kohta. Siia kuuluvad paigaldised, mis talitlevad pingetasemel alates väikepingest kuni kõrgepingeni. Termin kõrgepinge hõlmab ka neid pingetasemeid, mida nimetatakse keskpingeks ja ülikõrgepingeks. Nimetatud elektripaigaldised on ette nähtud elektrienergia tootmiseks, edastamiseks, muundamiseks, jaotamiseks ja kasutamiseks. Mõned nendest (nt tööstusettevõtete ja asutuste elektrijaotuspaiigaldised) on kestevtoimelised ja kohtkindlad, teised (nt ehitusplatsidel) on ajutised, kolmandad aga liikuvad või teisaldatavad kas pingestatud olekus või pinge- ja laenguvabadena (nt elektrijamiga kaevandusmasinad karjäärides ja ava-söekaevandustes). See Euroopa standard sätestab elektripaigaldiste ohutu käidu ja elektripaigaldistes, nende juures või lächedal sooritatavate töötoimingute ohutusnõuded. Need nõuded kehitavad operatiiv-, töö- ja hooldetoimingute kohta. Need kehitavad ka kõigi nii mitteelektritööde (nt öhu- või kaabelliinide läheduses tehtavate ehitustööde) kui ka elektritööde kohta, kui on tegemist elektrilise ohuga. See Euroopa standard ei lainene paigaldisi ja seadmeid kasutavatele tavaasikutele, kui paigaldised ja seadmed on projekteeritud ja paigaldatud sellistena, et neid võivad kasutada tavaasikud ning et nad vastavad sellekohaste standardite nõuetele. See Euroopa standard ei ole spetsiaalselt mõeldud kohaldamiseks allpool loetletud elektripaigaldistele. Kui aga ei ole muid juhiseid ega töötamisreegleid, võib selle standardi põhimõtted rakendada ka — mis tahes omal jõul liikuvatele öhu- või hõljuksöidukitele (need alluvad rahvusvaheliste lennundusnõuetele, mis on sel juhul rahvuslike nõuete ees ülimuslikud); — mis tahes omal jõul liikuvatele või veetavatele meresöidukitele (need alluvad rahvusvaheliste merendusnõuetele, mis on sel juhul rahvuslike nõuete ees ülimuslikud); — elektroonilistele telekommunikatsiooni- ja infosüsteemidele; — elektronaparatuuril põhinevatele mõõte-, juhtimis- ja automaatikasüsteemidele; — söe- jm kaevandustele; — rahvusvaheliste merendusnõuetele alluvatele merepaigaldistele; — söidukitele; — elektereosüsteemidele; — elektrialastele eksperimentaaluurimispaiigaldistele.

EVS-EN 50159:2010

Raudteealased rakendused. Side-, signalisatsiooni- ja andmetötlussüsteemid. Ohutusalane andmeside

Railway applications - Communication, signalling and processing systems - Safety-related communication in transmission systems

See Euroopa standard kehtib ohutusalaste elektrooniliste süsteemide kohta, mille digitaalside toimub läbi sidesüsteemi, mis pole tingimata ette nähtud ohutusega seotud rakenduste jaoks ning mis: — on projekteerija kontrolli all ega muutu oma eluajal; või — on osaliselt tundmatu või muutuv, kuigi volitamata ligipääs sellele on välistatav; või — pole projekteerija kontrolli all ja tuleb arvestada volitamata ligipääsu võimalust. Andmesidesüsteemiga saab ühendada nii ohutusalaseid kui ka ohutusega mitteseotud seadmeid. Standard kehitab ohutu andmeside üldnõuded andmesidesüsteemiga ühendatud ohutusalaste seadmete vahel. Seda Euroopa standardit rakendatakse andmesidesüsteemiga ühendatud ohutusalaste seadmete ohutusnõuete määramisel nende ettenähtud terviklikkuse tagamiseks. Ohutusnõudeid rakendatakse tavaiselt ohutusalastes ja standardi EN 50129 järgi projekteeritud seadmetes. Teatud juhtudel saab neid nõudeid rakendada ka andmesidesüsteemi muude seadmete korral niivõrd, kuivõrd ohutusmeetmed on rakendatakavat terviklike ohutusnõuete täitmiseks. Ohutusnõuete määramine on ohutusalaste elektrooniliste süsteemide ohutuse eeltingimuseks, kusjuures ohutusnõuete täitmiseks vajalikud kriteeriumid on määratud standardis EN 50129. Seega tuleb ohutuse ja kvaliteedi halduse töendid võtta standardist EN 50129. Selle standardi käsitlusallasesse kuuluvad andmesidega seotud funktsionaalset ja tehnoloogilist ohutust tagavad nõuded. See standard pole rakendatav olemasolevate süsteemide puhul, mis on käiki lastud enne standardi kehtivuse algust. See Euroopa standard ei määratle — andmesidesüsteemi, — andmesidesüsteemiga ühendatud seadmeid, — lahendusi (nt koostalitusvõime jaoks), — missugused andmed on ohutusalast ja missugused mitte. Avaliku andmesidesüsteemi kaudu omavahel ühendatud ohutusalastele seadmetele võivad toimida paljud erinevad infotehnoloogilised ohud, mille tõrjeks on kavandatud üldine halduslikke, tehnoloogilisi ja talitusaspekti hõlmav programm. Standardis käsitletakse siiski vaid juhuslikke sõnumirünnakuid ohutusalastele rakendustele, niivõrd kui see puudutab infotehnoloogilist turvalisust. See Euroopa standard ei hõlma üldisi infotehnoloogilisi turvaprobleeme ja kindlasti ei hõlma see infotehnoloogilisi turvaprobleeme seoses — ohutusalase informatsiooni konfidentsiaalsuse tagamisega, ja — andmesidesüsteemi ülekoormuse vältimisega.

EVS-EN 60079-0:2013

Plahvatusohtlikud keskkonnad. Osa 0: Seadmed. Üldnõuded

Explosive atmospheres - Part 0: Equipment - General requirements (IEC 60079-0:2011, modified)

Standardi IEC 60079 see osa määrab plahvatusohtlikes keskkondades kasutamiseks ette nähtud elektriseadmete ja Ex-komponentide konstruktsiooni, katsetamise ja tähistamise üldnõuded. Elektriseadmete talitluse eeldatavad standardsed keskkonnaolud (arvestades keskkonna plahvatusohtu) on • temperatuur -20°C kuni $+60^{\circ}\text{C}$, • rõhk 80 kPa (0,8 bar) kuni 110 kPa (1,1 bar) ja • rõhk, mille normaalne hapnikusaldo on mahu järgi 21 %. See standard ja muud seda täiendavad standardid määradavat lisakatsetuse nõuded seadmetele, mis talitlevad väljaspool standardset temperatuurivahemikku, kuid väljaspool standardset keskkonna rõhvahemikku või standardsest erineva hapnikusaldoega keskkonnas talitlivate seadmete korral võib vaja olla lisakaalutlus ja lisakatsetusi, eriti kaitseviiside korral, mis võltuvad leegi kustutamisest, nagu kaitseviisil „plahvatusröhukindel ümbris (d)“ (IEC 60079-1), või energia piiramisest, nagu kaitseviisil „sädemehohutu ehitus (i)“ (IEC 60079-11). MÄRKUS 1 Kuigi ülanimetatud standardsed keskkonnaolud lubavad temperatuurivahemiku -20°C kuni $+60^{\circ}\text{C}$, on seadmete normaalne ümbrustemperatuur, kui pole määratud ja tähistatud teisiti, vahemikus -20°C kuni $+40^{\circ}\text{C}$ (vt jaotis 5.1.1). Arvestatakse, et temperatuurivahemik -20°C kuni $+40^{\circ}\text{C}$ on sobiv enamiku seadmete jaoks ja et kõigi seadmete valmistamine vastavalt standardsete keskkonnaolude kõrgeimale temperatuuriile $+60^{\circ}\text{C}$ toobs kaasa mittevajalikke konstruktsioonilisi piiranguid. MÄRKUS 2 Selle standardi nõuded põhinevad elektriseadmete tekitatava süütamisohu hindamisel. Arvestatakavad süütamisallikad on seda liiki seadmete talitlusega normaalses tööstuskeskkonnas kaasnevad nähtused, nagu kuumad pinnad, mehaaniliselt tekitud sädedmed, mehaanilistest toimetest tingitud termiitreaktsioonid, elektrikaar ja staatlised elektrilahendused. MÄRKUS 3 On mõistetav, et seoses tehnika arenguga võib olla võimalik saavutada standardisarja IEC 60079 eesmärke plahvatuse vältimiseks meetoditega, mis pole praegu veel täielikult määratletud. Kui tootja soovib osaleda niisuguses arengus, võib seda standardit ja muid sarija IEC 60079 standardeid rakendada osaliselt. Tootja peab ette valmistama dokumentatsiooni, milles on selgelt määratletud, kuidas sarija IEC 60079 standardeid on kasutatud, ning esitatud muude rakendatud tehniliste lisalahenduste täielik selgitus. Eriksitse jaoks on reserveeritud tähis „Ex s“. Eriksitse „s“ standard IEC 60079-33 on ettevalmistamisel. MÄRKUS 4 Kui üheaegselt on olemas või tekkida plahvatusohtliku gaasi või põlevtolmu keskkond, tuleb arvestada nende mõlema ohu samaaegset olemasolu ning sellest tulenevat lisakaitsemeetmete rakendamise

vajadust. See standard ei säesta muid ohutusnõudeid peale nende, mis on vahetult seotud plahvatusohuga. Süütamisallikad, nagu adiabaatiline kokkusrumine, lõöklained, eksotermiline keemiline reaktsioon, isesüttiv tolm, lahtised leegid ja kuumad gaasid või vedelikud, ei kuulu selle standardi käsitusalaasse. MÄRKUS 5 Selliste seadmete jaoks tuleb koostada ohuanalüs, mis määrab kindlaks ja loetleb kõiki potentsiaalseid elektriseadmetega seotud süütamisohu allikaid ning meetmeid, mida tuleb rakendada selle ohu tekke vältimiseks. Seda standardit on täiendatud või muudetud järgmiste erikaitseviise käsitlevate standarditega: — IEC 60079-1. Gas – Flameproof enclosures „d“; — IEC 60079-2. Gas – Pressurized enclosures „p“; — IEC 60079-5. Gas – Powder filling „q“; — IEC 60079-6. Gas – Oil immersion „o“; — IEC 60079-7. Gas – Increased safety „e“; — IEC 60079-11. Gas – Intrinsic safety „i“; — IEC 60079-15. Gas – Type of protection „n“; — IEC 60079-18. Gas and dust – Encapsulation „m“; — IEC 60079-31. Dust – Protection by enclosure „t“; — IEC 61241-4. Dust – Pressurization „pD“. MÄRKUS 6 Lisainformatsiooni mitteelektrilistele seadmete kaitseviiside kohta saab leida standardist ISO/IEC 80079-36 (avaldamisel). Seda standardit on täiendatud või muudetud järgmiste seadmestandarditega: IEC 60079-13. Explosive atmospheres – Part 13: Equipment protection by pressurized room „p“ IEC 60079-25. Explosive atmospheres – Part 25: Intrinsically safe electrical systems IEC 60079-26. Explosive atmospheres – Part 26: Equipment with equipment protection level (EPL) Ga IEC 60079-28. Explosive atmospheres – Part 28: Protection of equipment and transmission systems using optical radiation IEC 62013-1. Caplights for use in mines susceptible to firedamp – Part 1: General requirements – Construction and testing in relation to the risk of explosion IEC 60079-30-1. Explosive atmospheres – Part 30-1: Electrical resistance trace heating – General and testing requirements See standard ja üldalnimetatud lisastandardid ei kehti järgmiste seadmete ehituse kohta: • elektriline meditsiiniparatuur, • tulirelvastükud, • süütikute katsetusseadmed, • lõhkaineid süütamisahelad.

EVS-EN 62563-1:2010

Elektrilised meditsiiniseadmed. Meditsiinilised kuvasüsteemid. Osa 1: Hindamismeetodid Medical electrical equipment - Medical image display systems - Part 1: Evaluation methods

Standardi IEC 62563 selles osas kirjeldatakse hindamismeetodeid meditsiiniliste kuvasüsteemide katsetamiseks. Selle rahvusvahelise standardi käsitusala hõlmab praktilisi katseid, mis põhinevad visuaalsel hindamisel või esmaste testseadmetega teostatud mõõtmistel. Nimetatud süsteemidel võib teha põhjalikumaid ja kvantitatiivsemaid mõõtmisi, kuid need jäävad selle dokumendi käsituslastest välja. See standard on kohaldatav meditsiinilistele kuvasüsteemidele, mis on suutelised kuvama monokroomset pildiinformatsiooni hallskala väärustena värvilisel või mustvalgel kuvasüsteemil (nt elektronkiiretoru (CRT) tüüpि kuvarid, lamekuvarid, projektorid). See standard on kohaldatav meditsiinilistele kuvasüsteemidele, mida kasutatakse diagnostika (meditsiiniliste piltide tölgendamine kliinilise diagnoosi määramiseks) või vaatluse (meditsiiniliste kujutiste vaatlemine meditsiinilisel eesmärgil ilma meditsiinilise tölgendamiseta) eesmärgil ja seega, mille puuhul on olemas erinõuded pildikvaliteedile. Selle standardi käsitusala ei kata peaskantavaid kuvasüsteeme ja kuvasüsteeme, mis on abiks positsioneerimisel ja süsteemi talitlemisel. Selle standardi käsitusalaesse ei kuulu vastavus- ja püsivuskatsete kriteeriumide ega püsivuskatsete sageduste määratlemine.

EVS-EN 71-4:2013

Mänguasjade ohutus. Osa 4: Katsekoplektid keemiakatseteks ja samalaadseks tegevuseks Safety of toys - Part 4: Experimental sets for chemistry and related activities

See Euroopa standard määrab nõuded teatud ainete ja segude maksimaalsele kogusele, mõnedel juhtudel maksimaalsele kontsentratsioonile, keemiakatseteks ja samalaadseks tegevuseks kasutatavates katsekoplektides. Need ained ja segud on: need, mis on EÜ seadusandlusega klassifitseeritud ohtlikeks, kuuludes ohtlike ainete [1] ja [2] ning ohtlike segude [2] ja [3] hulka; ained ja segud, mis ülemääraistes kogustes võivad kahjustada neid kasutavate laste tervist ning mis ei ole üldalmainitud seadusandlusega klassifitseeritud ohtlikeks; ja mis tahes teine (teised) koos katsekoplektiga väljastatav(ad) keemiline (keemilised) aine(d) ja segu(d). See standard on kohaldatav keemiakatseteks ja samalaadseteks tegevusteks kasutatavatele katsekoplektidele, kaasa arvatud kristallide kasvatamise komplektid, süsinikiööksiidi genereerimise katsekoplektid ja lisakoplektid. Selle alla kuuluvad ka mineraloogia-, bioloogia-, füüsika-, mikroskoopia- ja keskkonnateadusealased keemiakatsete komplektid, juhul kui need sisaldaud üht või mitut keemilist ainet ja/või segu, mis on klassifitseeritud vastavalt EÜ määrusele nr 1272/2008 [2] ohtlikeks. See standard määratleb ka nõuded märgistusele, sisu lootelule, kasutusjuhenditele, silmade kaitsevahendile ja katsete sooritamiseks ettenähtud varustusele. See standard ei kehti standardi EN 71-13 alla kuuluvatele mänguasjadale (nt kosmeetikakoplektid). Nõuded teatud teistele keemilistele mänguasjadale on esitatud standardis EN 71-5. MÄRKUS Terminid „aine“ ja „valmistis“ on sarnaselt direktiividle 67/548/EMÜ [1] ja 1999/45/EÜ [3] kasutusel ka „REACH määruses“, (EÜ) määrus nr 1907/2006 [4]. Kemikaalide klassifitseerimise ja märgistamise globaalse harmoniseeritud süsteemi (GHS) kohaselt, mis Euroopa Liidus seadustati (EÜ) määrusega nr 1272/2008 (ainete ja segude klassifitseerimine, märgistamine ja pakendamine) [2], tuleb järgida GHS käibelevõtmise ajakava. Nimetus „valmistis“ ja „segu“ peaks pidama sünönüümseteks; need mõlemad kujutavad endast ainete, mis omavahel ei reageeri, segu või lahust. Vana termin „valmistis“ asendatakse ettenähtud ajal uue terminiga „segu“. Selles standardis kasutatakse ainult terminit „segu“.

EVS-EN 858-2:2003

Kergete vedelike (nt öli ja bensiin) püüdursüsteemid. Osa 2: Nimimõõdu valik, paigaldamine, toimimine ja hooldamine

Separator systems for light liquids (e.g. oil and petrol) - Part 2: Selection of nominal size, installation, operation and maintenance

Seda Euroopa standardit rakendatakse reoveest mineraalse päritoluga hüdrokarbonaatide eraldamiseks kasutatavatele püüdursüsteemidele. See ei rakendu taimse või loomse päritoluga rasvainele ja ölidele ega emulsioonide ja lahuste eraldamisele. See Euroopa standard annab juhiseid standardi EN 858-1 põhjal toodetud ölipüüdurile nimimõõdu valikuks ja samuti paigaldamiseks, toimimiseks ja hooldamiseks. Selles antakse ka soovitusi puhastusvahendite sobivuse kohta, juhul kui neid juhitakse püüduriisse.

EVS-EN ISO 3183:2012

Nafta- ja maagasitööstus. Terastorud torutranspordisüsteemidele

Petroleum and natural gas industries - Steel pipe for pipeline transportation systems (ISO 3183:2010)

Selles rahvusvahelises standardis on määratud nõuded kahe tootespetsifikatsiooni taseme (PSL 1 ja PSL 2) ömbluseta ning keevitatud terastorude tootmiseks nafta- ja maagaasitööstuse torutranspordisüsteemidele. Standard ei ole rakendatav valatud torude puhul.

EVS-ISO/IEC/IEEE 15289:2013

Süsteemi- ja tarkvaratehnika. Elutsükli infosaaduste (dokumentatsiooni) sisu

Systems and software engineering -- Content of life-cycle information products (documentation) (ISO/IEC/IEEE 15289:2011)

See standard spetsifitseerib süsteemide ja tarkvara elutsükli kõigi piiritletud infoüksuste ning infotehnoloogiliste teenuste halduseks vajalike infoüksuste (dokumentatsiooni) otstarbe ja sisu. Infoüksuste sisu määratletakse vastavalt üldistuslikele dokumendiüüpidele, mis on esitatud peatükis 7, ja dokumenti konkreetsele otstarbele (peatükk 10). See standard eeldab, et organisatsioon rakendab elutsükli protsesse vastavalt standardile ISO/IEC 15288:2008 (IEEE Std 15288-2008) „Systems and software engineering — System life cycle processes“ või ISO/IEC 12207:2008 (IEEE Std 12207-2008) „Systems and software engineering — Software life cycle processes“, või sooritab teenusehaldust vastavalt standarditele ISO/IEC 20000-1:2005 „Information technology — Service management — Part 1: Specification“ ja ISO/IEC 20000-2:2005 „Information technology — Service management — Part 2: Code of practice“. ISO/IEC 12207:2008 (IEEE Std 12207-2008) ja ISO/IEC 15288:2008 (IEEE Std 15288-2008) määratlevad ühe protsessikogumi, millega hallata ja sooritada süsteemi elutsükli järke. Need määratlevad teabehalduse protsessi, kuid nad ei „detailiseeri dokumentatsiooni selle nimetuste, vormingu, otseste sisu ja talletava infokandja mõttes“ [ISO/IEC 15288:2008 (IEEE Std 15288-2008), 1.4]. ISO/IEC 12207:2008 (IEEE Std 12207-2008) rajab elutsükli protsesside ühe ühise karkassi ning piiritleb see-juures rea dokumentatsiooniüksusi või nõuab neid. Protsessi etalonmudel ei esinda mingit kindlat lähenemisviisi protsessi teostamisele ega kirjuta ette mingit süsteemi või tarkvara elutsükli mudelit, metoodikat ega meetodit. ISO/IEC 20000-1:2005 kehtestab üldised nõuded dokumentidele ja andmikele (3.2). ISO/IEC 12207:2008 (IEEE Std 12207-2008) ei täpsusta alati, millal tuleb koostada tarkvara infoüksused ega piiritle infoüksuste sisu. See standard seab ISO/IEC 15288:2008 (IEEE Std 15288-2008) ja ISO/IEC 12207:2008 (IEEE Std 12207-2008) jaotised vastavusse ühe infoüksuste kogumiga. Üldistuslike dokumentiüüpe (mida võib nimetada infoüksuste tüüpideks) tuleb kasutada sellise teabe piirilemiseks, mida vajatakse ISO/IEC 15288:2008 (IEEE Std 15288-2008) leppe-, ettevõtte-, projekt- ja tehni-liste protsesside, ISO/IEC 12207:2008 (IEEE Std 12207-2008) primaar-, abi- ja organisatsioniliste elutsükli-protsesside või ISO/IEC 20000-1:2005 teenusehalduse protsesside toetuseks. See standard piiritleb andmikud ja infoüksused ISO/IEC 15288:2008 (IEEE Std 15288-2008), ISO/IEC 12207:2008 (IEEE Std 12207-2008), ISO/IEC 20000-1:2005 ja ISO/IEC 20000-2:2005 viidete analüüsiga põhjal; mõnedel juhtudel pakuvad need viited konkreetsete dokumentide sisu täielikke või osalisi visandeid. Nõuded elutsükli protsessidele ei sõnasta aga üheselt ja ühemõtteliselt nõudeid infoüksuse sisule ega teabele, mida vajab infoüksuse kasutaja. Peale selle võib elutsükli protsessidest pärit teave osaliselt kattuda või see võidakse luua ja läbi vaadata eri aegadel. Ühesõnaga ei anna analüüsitud viited tulemuseks infoüksuste loogiliselt täielikku loetelu. Elutsükli iga protsessi puul oleks võimalik koostada plaani, protseduure ja aruandeid, samuti rohkeid andmikke, taotlusi, kirjeldusi ja spetsifikatsioone. Niisugune dokumentatsioonisõkeemi detailiseering oleks rangem sellest, mida spetsifitseerib ISO/IEC 15288:2008 (IEEE Std 15288-2008) või ISO/IEC 12207:2008 (IEEE Std 12207-2008). Nagu rõhutab ISO/IEC 15288:2008 (IEEE Std 15288-2008) (jaotis 1.4): „See standard ei detailiseeri elutsükli protsesse neile esitatavate nõuetate rahuldamiseks ja tulemite saavutamiseks vajalike meetodite ega protseduuride mõttes.“ Niisiis võib infoüksusti vastavalt projekti või organisatsiooni eesmärkidest tulenevatele vajadustele ühendada või tükeldata; lähemalt on seda käsitledud peatükis 2 („Rakendatavus“) ja peatükis 3 („Vastavus“). Selle standardi käsitlusalaasse ei kuulu: a) soovitatavate lähteandmete või lähte-infoüksuste vorming või sisu, välja arvatud niisuguste lähteüksuste sisu, mis on ühtlasi tulem-infoüksused; b) loomult sarnaste infoüksuste ja nende sisu ühendamise või tükeldamise juhisid; c) süsteemi ja tarkvara elutsükli andmete, andmike, infoüksuste või dokumentatsiooni sobiva esitus-vormingu, väljastuskandja ja hooldustehnoloogia, näiteks elektroonilise kirjastamise süsteemide, sisuhalduse süsteemide või andmehoidlate valimise juhisid; d) äritegevuse, organisatsiooni ja rahanduse üldise haldusega seotud infoüksuste detailne sisu, mis ei ole spetsifiline süsteemi- ja tarkvaratehnikal ega infotehnoloogia teenusehaldusele, näiteks äristrateegiad, inimressursi- ja investeerimispoliitikad, personali valimise kriteeriumid, eelarvestuse ja rahalise arvestuse poliitikad ja protseduurid, kuluaruanded või palgaandmed; e) infoüksused, mis tööndavad ainult ISO/IEC 12207:2008 (IEEE Std 12207-2008) ühe sätte, näiteks ISO/IEC 12207:2008 (IEEE Std 12207-2008), sätte 6.1.2.3.4.5 järgimist; f) ükski ISO/IEC 15288:2008 (IEEE Std 15288-2008) või ISO/IEC 12207:2008 (IEEE Std 12207-2008) sätte, mis ei määra otsest ega kaudselt teabe jäädvustamist mingi tegevuse või töö kohta, näiteks ISO/IEC 12207:2008 (IEEE Std 12207-2008) sätte 6.4.4; g) töösaadused, mudelid, tarkvara ning muud elutsükli saaduste ja teenuste tehisid, mis ei ole infoüksused ega infoüksustes kasutatavad andmikud. MÄRKUS 1 Tarkvara kasutajadokumentatsiooni vormingute kohta annab juhiseid ISO/IEC 26514:2008 „Systems and software engineering — Requirements for designers and developers of user documentation“. MÄRKUS 2 Töösaaduste ja infoüksuste sisu detailiseerib ISO/IEC TR 15504-5:1999 „Information technology — Software Process Assessment — Part 5: An assessment model and indicator guidance“. Selle juhised kirjeldavad infoüksuste (dokumentide) kogumit, millega hindajal tuleb võib-olla tegemist teha. Nendes juhistes nimetatud infoüksusi võidakse luua selles standardis nõutavaid infoüksusi ühendades ja tükeldata.

STANDARDPEALKIRJADE MUUTMINE

Selles jaotises avaldame infot Eesti standardite eesti- ja ingliskeelsete pealkirjade muutmise kohta ja ingliskeelsete pealkirjade tõlkimise kohta.

Lisainformatsioon või ettepanekud standardipealkirjade ebatäpsustest enquiry@evs.ee.

UUED HARMONEERITUD STANDARDID

Toote nõuetele vastavuse seaduse kohaselt avaldab Eesti Standardikeskus oma veebilehel ja ametlikus väljaandes teavet harmoneeritud standardeid ülevõtvate Eesti standardite kohta.

Harmoneeritud standardiks nimetatakse EÜ direktiivide kontekstis Euroopa Komisjoni mandaadi alusel Euroopa standardimisorganisatsioonide koostatud ja vastu võetud standardit.

Harmoneeritud standardite kasutamise korral eeldatakse enamiku vastavate direktiivide mõistes, et standardi kohaselt valmistatud toode täidab direktiivi olulisi nõudeid ning on seega reeglina kõige lihtsam viis töendada direktiivide oluliste nõute täitmist. Harmoneeritud standardi täpne tähdus ja õiguslik staatus tuleneb siiski iga direktiivi tekstist eraldi ning võib direktiivist olenevalt erineda.

Lisainfo:

<http://www.newapproach.org/>

<http://ec.europa.eu/enterprise/policies/european-standards/harmonised-standards/>

Eesti Standardikeskus avaldab ametlikus väljaandes harmoneeritud standardeid ülevõtvate Eesti standardite kohta järgmist infot:

- harmoneeritud standardi staatuse saanud Eesti standardid
- harmoneeritud standardi staatuses olevate Eesti standardite kohta avaldatud märkused ja hoiatused, mida tuleb standardite järgimisel arvestada
- harmoneeritud standardi staatuse kaotanud Eesti standardid

Info esitatakse vastavate direktiivide kaupa.
