EESTI UUDISED

20. märtsil esitas Standardikeskus avalduse CEN ja CENELEC täisliikmeks saamiseks.

Eesti standardiorganisatsiooni kuulumine Euroopa standardiorganisatsioonidesse on oluliseks eeltingimuseks Eesti vastuvõtmisel Euroopa Liitu.

Täisliikmeks saamiseks peab EVS täitma mitmed tingimused. Ta peab olema suuteline osalema Euroopa standardite koostamises ja hääletamises, omama selleks vajalikku IT baasi ja kompetentset personali. Eesti standardiks peab olema üle võetud vähemalt 80 % Euroopa standarditest. Auditit positiivsete tulemuste korral otsustatakse EVS täisliikmeks saamine Euroopa Standardikomiteede aastakoosolekul.

4. märtsil 2003 toimus Standardikeskuses seminar teemal "**Standarditele viitamine õigusaktides**". Ettekannetega esinesid EVS tegevdirektor Sven Kasemaa ja Majandus- ja Kommunikatsioniministeeriumi tööstusosakonna juhataja Merike Kompus. Standardiinfo leidmist tutvustas EVS peaspetsialist Signe Ruut.

20. märtsil toimus Standardikeskuses seminar "**Sissejuhatus standardimisse**". Ettekannetega esinesid EVS tegevdirektor Sven Kasemaa, standardiosakonna juhataja Raul Juhanson, tehniliste komiteede spetsialist Mare Annsoo ning Majandus- ja Kommunikatsioniministeeriumi tööstusosakonna peaspetsialist Priit Kikas.

27. märtsil külastas EVS-i Rotterdami Erasmuse Ülikooli standardimisprofessor ning Hollandi Standardiinstituudi standardimise vanemkonsultant **Dr Henk J. de Vries**, kes kohtus EVS juhtkonna ja standardiosakonna töötajatega ning tegi ettekande teemal "Rahvuslik standardiorganisatsioon oma kliente teenindamas".

Majandus- ja kommunikatsioniministri 4. märtsi 2003. a määrusega nr 40 kehtestati "**Aktiisikauba mõõtmiseks kasutatavate mõõtevahendite metrooloogilistele omadustele esitatavad nõuded**"

Käesolevas määruses on metrooloogiaalaseid põhimõisteid kasutatud vastavalt Eesti standardile EVS 758:1998 «Metroloogia. Terminid ja määratlused».

§ 3. Nõuded mõõtevahendite metrooloogilistele omadustele

(4) Mahuühikutes mõõdetud kütuse koguse väljendamiseks massiühikutes tuleb tagada arvutuse laiendmääramatuse väärthus tõenäosustasemeil 95% $\pm 0,02\%$. Selle nõude täidetust eeldatakse, kui arvutustes on kasutatud rahvusvahelise standardi ISO 91-1 naftasaaduste mõõtmiste tabeleid 53A, 53B, 54A, 54B².

20. märtsil esitas EVS avalduse CEN/CENELEC täisliikmeks saamiseks. See paneb EVS ette uued ülesanded - lisaks kavandite arvamusküsitluse korraldamisele tuleb hakata osalema ka kavandite hääletamisel. Täisliikme staatus tähendab ühtlasi, et peab hakkama aktiivsemalt osa võtma Euroopa standardite koostamisest. Samas tekib aga suurem võimalus mõjutada uute standardite sisu Eestile vajalikus suunas.

Selles EVS Teataja numbris on arvamusküsitlusele pandud eestikeelsed pakendistandardite kavandid. Uute standarditeks on ilmunud neli viimast osa infotehnoloogia sõnastikust. Seega on IT valdkond kaetud eestikeelsete terminite ja määratlustega. Terminoloogial on standardimises tildse tähelepanuvääorne koht. Selle tunnistuseks on ka aprillis EVS korraldusel toimuv terminoloogia jätkuseminar.

Kaks pikemat artiklit on seekord kvaliteedi- ja metroloogiaavallast. Huvitavat mõttteainet pakub Eesti Kvaliteedijuhtimiskeskuse ja Kvaliteediühingu koostöös valminud sertifitseeritud ettevõtete kvaliteedikulude võrdlusuring. Elektripaigaldiste parameetrite võrdlusmõõtmise muutus oluliseks seoses akrediteerimisnõuete esitamisega mõõtelaboritele seadusandluse (Elektriohutusseadus) poolt. Võrdlusmõõtmiste tulemustega saatte tutvuda E. Kulderknupi artiklis.

DIREKTIIVID LIHTSAMAKS

Euroopa Komisjon tegi ettepaneku lihtsustada elektromagnetilisest ühilduvuse direktiivi (89/336/EEC).

Elektromagnetilise ühilduvuse direktiiv kehtib Euroopa Liidus alates 1. jaanuarist 1996. Direktiiv peaks piirama ning vähendama võimalike häirete teket erinevate elektriliste ning elektrooniliste seadeldiste puhul nagu nt kodumasinad, jõujaamad, telekommunikatsiooni- või elektrivõrgustikud. Euroopa Komisjoni liige, ettevõtluse ja infoühiskonna volinik Erkki Liikanen ütles ühes oma viimastest sõnavõttudest, et tehtud ettepanek demonstreerib olukorda, kus siseturu toimimist ning ettevõtete konkurentsivõimet püütakse efektiivselt parandada just regulatiivsete tekstide lihtsustamise kaudu.

Direktiivil on kaks põhilist suunist, mida tuleb järgida.

Elektromagnetiline emissioon ei tohi takistada teiste seadeldiste korrektset töötamist. Näiteks ei tohi mikrolaineahi

takistada raadiosignaalide vastuvõtmist. Teisest küljest peab seadis olema piisavalt immuunne kõikvõimalikele elektromagnetilistele lainetele, mis keskkonnas eksisteerivad - näiteks ei tohiks raadio alarm hakata tööle mobiiltelefoni lähedusest.

Elektromagnetilise ühilduvuse direktiiv on loodud eesmärgiga kaitsta eelkõige tarbijaid, kuid samas ka tööstust ning selle seadmeid elektromagnetiliste võngete tagajärgede eest.

Komisjoni ettepanekul on muudatuste tegemise eesmärgiks eelkõige protseduuride lihtsustamine tootjatele (teatud protseduurireeglite kaotamine, kulutuste vähendamine), samal ajal tahetakse suunata enam tähelepanu informatsiooni levikule ning põhjaliku dokumentatsiooni koostamisele erinevate toodete ning tootegruppide kohta. Praeguses direktiivis eksisteerib kolm erinevat vastavushindamise protseduuri, mille vahel peab ettevõtja valima

olenevalt seadeldisest ning sellest, kas harmoneeritud standardid on konkreetsele tootele kohaldatavad või mitte. Kaks neist protseduuridest nõudsid kohustuslikku sõltumatu inspektsiooni või sertifitseeritud asutuste osalemist protsessis. Uus tekst teeb tootjad ainuisikuliselt vastutavaks oma toodete vastavushindamise ning CE-märgistuse kinnitamise eest. See teeb protseduuri reeglid lihtsamaks ning vähendab tootjate kulutusi, suurendab aga seejuures ettevõtjate vastutust.

Rangemad nõudmised on informatiooni ning dokumentatsiooni täpsuse, täielikkuse ja läbipaistvuse osas. Näiteks peab tootja edastama toote identifitseerimiseks selle täpsed andmed (tüüp, seerianumber jne), samuti enda või oma agendi nime ning aadressi ning juhul, kui

vajalik, ka Euroopa Liidu territooriumil asuva importööri kontaktandmed. Sellega tekiv suurem läbipaistvus peaks võimuorganitele turusituatsiooni jälgimise kergemaks tegema.

Turult kõrvaldatakse tooted, mille päritolu on võimatu tegelikkuses kindlaks teha, mis omakorda soodustab ausat konkurentsi ettevõtjate vahel.

Eestis reguleerib vastavat valdkonda "Elektriohutusseadus". Eesti standardiks ülevõetud harmoneeritud standardite loeteluga saate tutvuda aadressil <http://www.evs.ee/images/pdf/89-336.pdf>

Eesti Kaubandus-Tööstuskoja Teatajas ilmunud artiklit refereeeris AL

MÄRTSIKUU STANDARDID

Eesti keeles on nüüd ilmunud tervikuna 35-osaline infotehnoloogia sõnastik. Viimasena ilmus sõnastiku neli osa, mis käsitlevad teemasid - hüpermeedium ja multimeedium, võrgundus ning virtuaalreaalsus. Infotehnoloogia sõnastiku ilmunud neli järgnevat osa on ISO tehniline alamkomitee JTC1/SC1 töödokumentide tõlked. Töödokumentide tõlked seetõttu, et seoses terminoloogialase alamkomitee JTC1/SC1 töö lõpetamisega ei ole kavas antud töödokumente viia standardi kujule. Samas peeti otstarbekaks terminoloogia katwuse vajadusest tulenevalt ka need osad avaldada Eesti standardina.

EVS 2382-30:2003 Infotehnoloogia. Sõnastik. Osa 30: Raalnägemine

Standard on mõeldud soodustama rahvusvahelist suhlust infotehnoloogias. Ta esitab infotehnoloogia valdkonna jaoks oluliste valitud mõistete terminid ja määratlused kahes keeles ning määratleb artiklite vahelised seosed. Standard määratleb raalnägemisega seotud mõisteid. Raalnägemine e tehishnägemine on funktsionaalüksuse võime hõivata,

töödelda ja interpreteerida visuaalandmeid.

EVS 2382-33:2003 Infotehnoloogia. Sõnastik. Osa 33: Hüpermeedium ja multimeedium.

Standard esitab infotehnoloogia valdkonna jaoks oluliste valitud mõistete terminid ja määratlused kahes keeles ning määratleb artiklite vahelised seosed. Standard määratleb hüpermeediumiga ning multimeediumiga seotud mõisteid. Meedium on vahend, millega andmeid tajutakse, kuvatakse, salvestatakse või edastatakse. Multimeedium on omane mitme meediumitüibi kombinatsiooni kasutamisele. Hüpermeedium on hüpermeediumiliste mõistete, rakenduste ja meetodite valdkond.

EVS 2382-35:2003 Infotehnoloogia. Sõnastik. Osa 35: Võrgundus

Standard esitab infotehnoloogia valdkonna jaoks oluliste valitud mõistete terminid ja määratlused kahes keeles ning määratleb artiklite vahelised seosed. Standard määratleb võrgundusega seotud mõisteid. Võrgundus on arvutivõrkude rajamise, ekspluatatsiooni

ja kasutamisega seotud meetodite kogum.

EVS 2382-37:2003 Infotehnoloogia. Sõnastik. Osa 37: Virtuaalreaalsus
Standard esitab infotehnoloogia valdkonna jaoks oluliste valitud mõistete

terminid ja määratlused kahes keeles ning määratleb artiklite vahelised seosed. Standard määratleb virtuaalreaalsusega seotud mõisteid. Virtuaalreaalsus on virtuaalilmas osaleja tajumused ja kogetav.

SERTIFITSEERITUD ETTEVÕTETE KVALITEEDIKULUDE VÕRDLUSUURING

Analüüs ja järelased

Üldist

Eesti Juhtimiskvaliteedi Keskus koostöös Eesti Kvaliteediühinguga teostas jaanuaris 2003 uuringu, mille eesmärgiks oli:

1. selgitada välja, kuivõrd on ISO 9000 seeria standardi alusel sertifitseeritud ettevõtted teadlikud oma kvaliteedisüsteemi olemasolu finantsmõjudest ettevõttele;
2. anda tagasisidet kvaliteedikuludest võrdlusinformatsioonina küsitluses osalenud ettevõtetele;
3. saada informatsiooni selle kohta, mil määral ISO 9000 sertifikaat ja sellele vastav kvaliteedisüsteem täidavad ettevõtete ootusi;
4. leida juhtimise parimaid praktikaid kvaliteedisüsteemi mõjude mõõtmisel.

Uuringu ühe põihüpoteesi kohaselt ei ole sertifitseeritud ettevõtted enamasti küllaldaselt teadlikud oma kvaliteedikuludest ja kvaliteedisüsteemi olemasolu finantsmõjudest.

Küsitlus saadeti E-emaili teel 130-le ettevõttele ning sellele vastas 40 ettevõtet (30,7%).

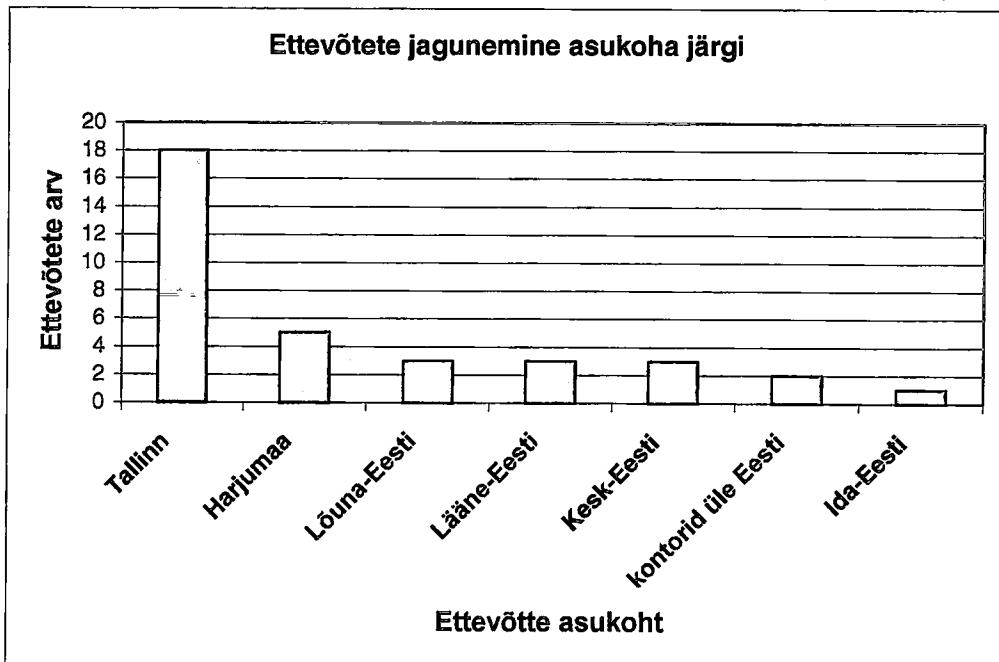

Käesolevas analüüs is on käsitletud tulemusi küsimuste kaupa ning lõpuks esitatud küsitluse tulemused tervikuna. Toodud protsentarvud ei moodusta alati 100 %, kuna vastajatele jäeti valikuvõimalus jäätta osale küsimustest vastamata.

Tulemused ja järelased küsimuste lõikes

I osa: ÜLDANDMED

Küsitletud ettevõtete tegevusvaldkonnad on väga erinevad. Üle poole (57 %) tegelevad tootmisega. Teenuse osutajaid on 43 %, neist enamus (53%) tegutseb ehituse valdkonnas. Ehitusega tegelevaid ettevõtteid oli vastanute üldarvust 23%. ISO 9000 seeria standardile vastava kvaliteedisüsteemi populaarsust ehituse valdkonnas seletab kindlasti järest sagedamini ehitajale esitatav vastava sertifikaadi olemasolu nõue – eriti just riigihangetel osalemisel. Ehitusettevõtetel puuduvad alternatiivid oma kvaliteedisüsteemi olemasolu tööstamise kohta.

Enamus vastanud ettevõtetest paikneb Harju maakonnas ja Tallinnas, mis vastab üldisele ettevõtete jaotumisele Eestis. Seevastu on sertifitseeritud ettevõtete arv vähene Eesti idapoolses osas. Põhjus võib seisneda selles, et ettevõtete arendustegevuse jaoks vajalikud teenused pole venekeelsetele ettevõtetele piisavalt kättesaadavad. (vt tabel 1)

Tabel 1: Ettevõtete jagunemine asukoha järgi

Vastajad olid enamasti kvaliteedijuhid (57%), paaril korral vastas küsitlusele finantsjuht. Paljudel juhtudel, sealhulgas isegi suuremate ettevõtete puhul vastas küsitlusele peadirektor (14%), mis on väga positiivne, kuna tippjuhi pühendumisest sõltub oluliselt ettevõtte jätkusuutlik areng.

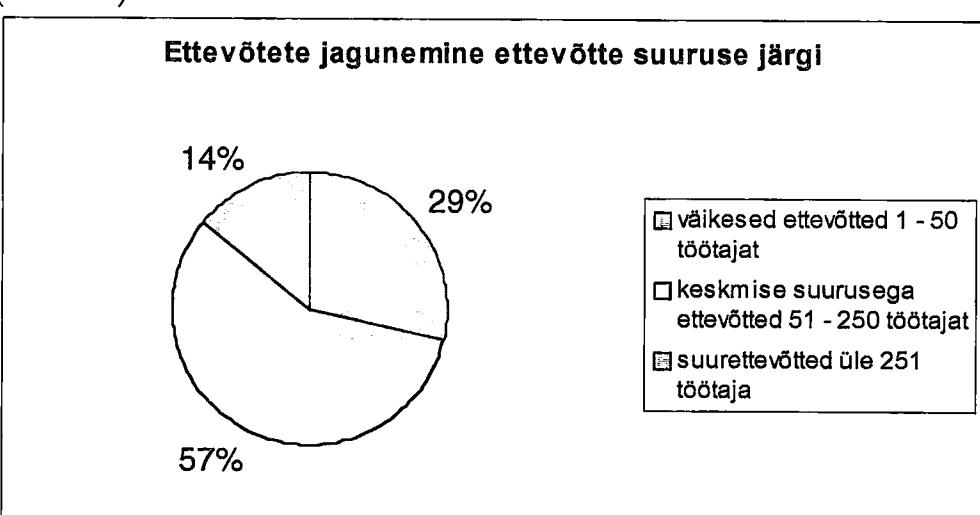

Töötajate arvu järgi jaotusid ettevõtted järgmiselt:

Väikese suurusega ettevõtted (1 – 50 töötajat) – 10 ettevõtet

Keskmise suurusega ettevõtted (51 – 250 töötajat) – 20 ettevõtet

Suurettevõtted (üle 251 töötaja) – 5 ettevõtet

(vt tabel 2)

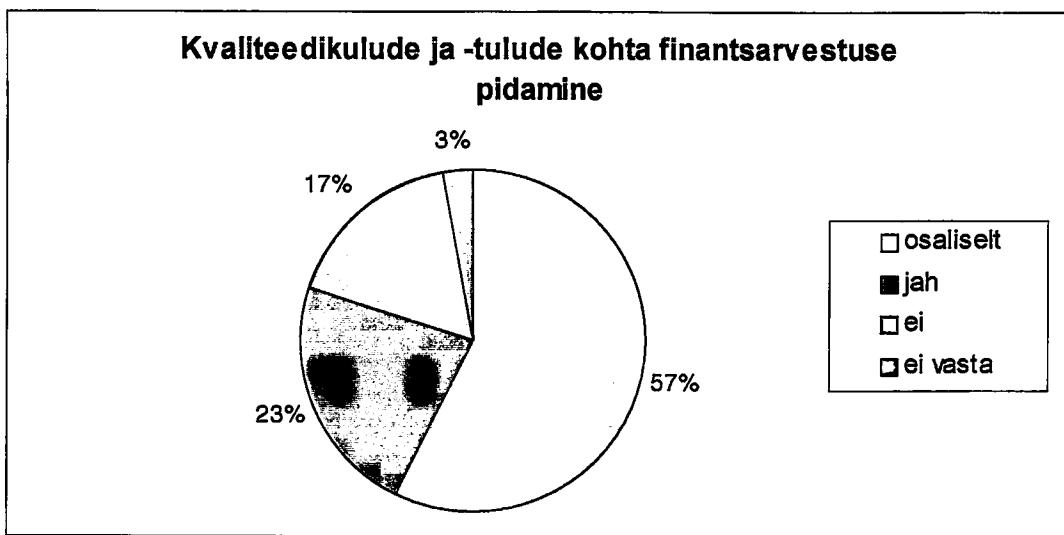

Tabel 2: Ettevõtete jagunemine ettevõtte suuruse järgi

Kvaliteedisüsteemi sertifitseerimise populaarsus kasv on märgatav alates 30 töötajaga ettevõtetest. Väiksematel firmadel on töenäoliseks takistuseks ressursside vähesus. Samuti on väikese kollektiivi puhul vähem võimalusi rakendada süsteemseid juhtimismetoodikaid. Juhtimiskvaliteedi alase arendustegevuse tunnustamise võimalused on eriti piiratud alla 30 töötajaga ettevõtetes.

II osa: ETTEVÖTTE KVALITEEDIKULUD JA -TULUD

Poolel vastanutest (51%) katab kvaliteedisüsteem ettevõtte kogu töötajaskonna. Küsitlusest ei selgu, mis põhjusel ülejäänud ettevõtete puhul osa töötajaskonnast on sertifikaadiga katmata ning näiteks ettevõtte tegevusalal või suurusel ei tundu olevat seost osalise kattuvusega. Samas on teada, et ettevõtted ei pruugi sertifitseerida kõiki tootmisi liine või tegevusalasid. Samuti võib osa tugiteenuseid (näiteks raamatupidamine, koristamine) olla väljaspool kvaliteedisüsteemi. ISO 9000 standard pole oma olemuselt terviklik kogu organisatsiooni hõlmav standard, vaid keskendub toote ja teenuse kvaliteedi tagamisele.

Finantsarvestust kvaliteedikulude ja –tulude kohta peetakse kas osaliselt või täies mahus 80% vastanud ettevõtteist. See tulemus näitab, et ettevõtted on enamasti huvitatud kvaliteedisüsteemi finantsmõjudest. 17 % (6 ettevõtet) siiski ei arvesta oma kvaliteedi-kulusid ja –tulusid. (vt tabel 3)

Tabel 3: Kvaliteedikulude ja –tulude kohta finantsarvestuse pidamine

See tõstatab küsimuse, mille alusel teostab juhtkond nendes ettevõtetes ISO 9000 standardis nõutud juhtkonna-poolset ülevaatust, hindamaks kvaliteedisüsteemi toimivust. Võiks oletada, et mittearvestajad on väike- või mikroettevõtted, kuid küsitlusest ilmneb, et viies ettevõttes kuuest kvaliteedikulude ja –tulude mittearvestajast on töötajaid vahemikus 30 – 70 ning ühel mittearvestajal on töötajaid üle kahesaja. Võib väita, et peaegu viiendik küsitlusele vastanutest (kvaliteedikulusid- ja –tulusid mittearvestajad) esindab ettevõtteid, kus kvaliteedisüsteem on sertifitseeritud rohkem välistel kui sisemistel põhjustel.

Erinevaid kululiike ja nende mõõtmist teostatakse järgmiselt:

Väliseid törkekulusid (*kvaliteediprobleemidega seotud kulud, mis tekivad pärast toote või teenuse müüki kliendile, näiteks reklamatsioonide lahendamisega seotud kulud, müüdud toodete parandamine ja remont, garantiasendused, tagasitoimetuskulud, halvenenud maine tõttu kaotatud kliendid*) mõõdetakse 60 % vastanud ettevõtetest, kuid uurimusest ei selgu, mida konkreetsed ettevõtted tegelikult mõõdavad. 37 % ettevõtetest ei mõõda väliseid törkekulusid.

Mittemõõtjate hulgas on võrdsesti tootmis- ja teenindusettevõtteid.

Sisemisi törkekulusid (*kvaliteediprobleemidega seotud kulud, mis tekivad ettevõtte sees, enne toote või teenuse müüki kliendile, näiteks praat, ümbertegemine, tõrgete analüüs jms*) mõõdetakse vähemalt osaliselt 40 % vastanud ettevõtetest. Väiksem arv kui väliste kulude mõõtmise osas on põhjendatav sellega, et sisemisi törkekulusid on välistest törkekuludest keerulisem hinnata. 51 % vastanust ei mõõda sisemisi törkekulusid.

Ennetuskulusid (*kulud, mis tehakse kvaliteediprobleemide vältimiseks, näiteks toote või teenuse spetsifitseerimine, kvaliteedisüsteemi arendamine, koolitus jms*) jälgib 57 % ettevõtetest.

Ennetuskulud on veidi laialivalguv mõiste ning küsitlusest ei selgu, kui suures ulatuses ennetuskulusid jälgitakse.

Kvaliteidisüsteemi töökorras hoidmisesega seotud kulusid (*näiteks siseauditid*) jälgivad pooled (51 %) vastanutest.

Sertifitseerimiskulud (*sertifitseerimisauditid, järelauditid jne*) on välised kulud, kuid siiski üllatavalt 11 % küsitlusele vastanud sertifitseeritud ettevõtetest ei arvesta neid kulusid. Võimalik, et need kulud on kantud kokku teiste samaligiliste kuludega ning seega ei leia eraldi kajastamist.

Konsultatsioonikulusid (*kvaliteedi juhtimissüsteemi juurutamine ja arendamine*) ei arvesta 20 % ettevõtetest. Küll aga on osa vastanutest märkinud mittearvestamise ka sel juhul, kui konsultante pole kasutatud ning seega suur number tingimata ei kajasta arvestuse pidamise ebatäpsust.

Kvalitedieesmärkide finantsväärtsused 2002. aastal

a)Kulude osas:

Välised törkekulud on 37 %-l vastanutest vähnenenud vörreldes aastaga 2001.

Finantsväärtsuste küsimus tundub olevat küsitletavate jaoks sensitiivne, kuna 20 % otsustas mitte avalikustada informatsiooni väliste törkekulude vähinemise kohta.

Sisemised törkekulud on vörreldes aastaga 2001 vähnenenud 26%-l vastanutest. 31 % jättis küsimusele vastamata. Sisemiste törkekulude mõõtmine on väliste kulude mõõtmisest keerulisem.

Vastanute erinevused ja suhteliselt vähene arv ei luba teha lisajäreldusi törke-, ennetus- ning töökorras hoidmisse kulude suuruse osas.

Sertifitseerimiskulud olid ettevõtetel keskmisel 50000 krooni.

Töötajate arvu järgi jaotusid sertifitseerimiskulud järgmiselt (vt tabel 4):

1 – 5 töötajat, keskmiselt 10000 krooni

6 – 15 töötajat, keskmisel 10900 krooni

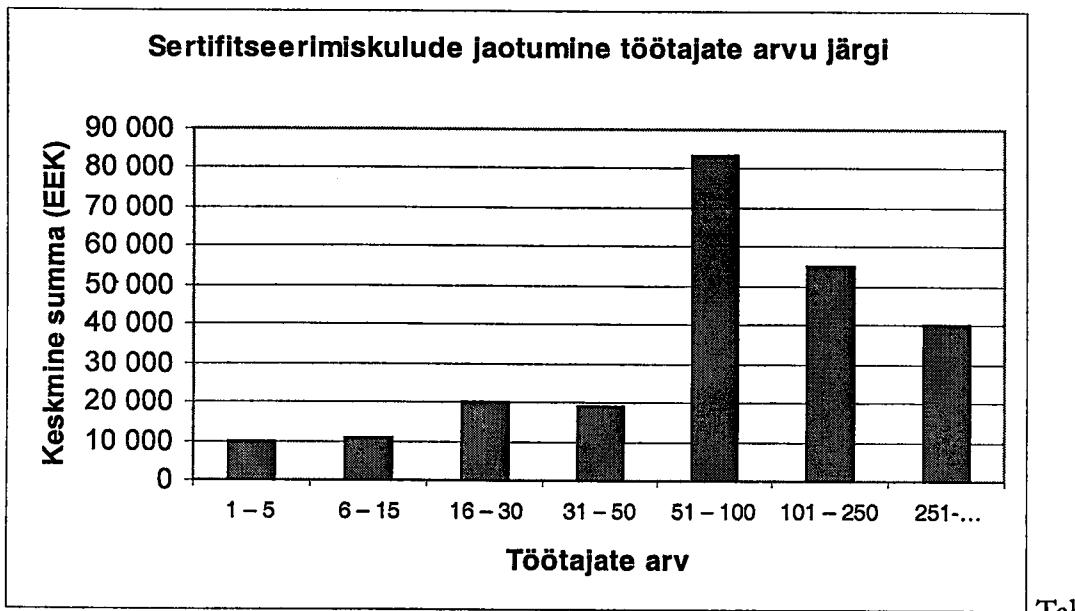

16 – 30 töötajat, keskmiselt 20000 krooni

31 – 50 töötajat, keskmiselt 19000 krooni

51 – 100 töötajat, keskmiselt 83125 krooni kuid miinimum oli 17000 ja maksimum 300000 krooni!

101 – 250 töötajat, keskmiselt 55258 krooni

üle 250 töötaja, keskmiselt 40000 krooni

Tabel

4: Sertifitseerimiskulude jaotumine töötajate arvu järgi

Sertifitseerimiskulude kõikumist võib seletada sellega, et sertifitseerimisteenust on raske diferentseerida ja seega on võimalik hindade osas kaubelda. Kuid see fakt ei põhjenda uurimuses ilmnevast maksumuste suurt erinevust, kuna on võimalik, et vastajad on saanud küsimusest erinevalt aru. Osa vastajatest võis arvestada üksnes järelvalve auditite maksumusi ning sertifitseerimiskuludesse võidi kanda lisaks sertifitseerimisasutuste kuludele ka muid sertifitseerimisega seondunud kulutusi.

Konsultatsioonikulud olid summa avalikustanud ettevõtetel keskmiselt 28000 krooni, varieerudes vahemikus 1.500 kuni 170000 krooni. Vastanute erinevused ja suhteliselt vähene arv ei luba teha lisajäreldusi konsultatsioonikulude suuruse osas.

b) Tulude osas:

ISO sertifikaadi omamine on andnud eeliseid partnerite leidmisel 43 % vastanutest ning 46% arvates ka klientide leidmisel. Välisklientide leidmisel on sertifikaat aidanud 26 % vastanutest. See on kõrge protsent, arvestades seda, et suur osa ettevõtetest ei tegele ekspordiga. On selgelt näha, et sertifikaat, mis on kolmanda osapoole sõltumatu tunnustus, mõjutab suhtlemist klientide ja partneritega positiivselt ja loob aluse usaldusele.

Enamus ettevõtetest (77%) ei mõõda kasvanud tellimuste arvu. Kaks erineva tegevusalaga (tootmine ja ehitus) ettevõtet tõid välja konkreetse kasvanud tellimuste arvu.

Kokkuvõte:

Uuringu üks põhihüpoteesidest oli, et sertifitseeritud ettevõtted pole enamasti piisavalt teadlikud oma kvaliteedikuludest ja kvaliteedisüsteemi olemasolu finantsmõjudest.

Küsitletud tulemusid kinnitasid selle hüpoteesi paikapidavust.

Tulude ja kulude arvestamise osas võib järeldada, et arvestamise praktika on enamasti puudulik ja väga ebaühtlane. Ebaühtlane praktika välistab kulude võrdlemise ettevõtete vahel. Selleks et teostada võrdlus, tuleks hoolega jälgida vörreldavate ettevõtete arvestussüsteemide kokkusobivust. Ulatuslikumate järelduste tegemiseks ISO 9001 järgi sertifitseeritud ettevõtte kvaliteedisüsteemi mõjudest tuleks ettevõtet vörrelda sarnase mittesertifitseeritud ettevõttega. Kindlasti on järelduste tegemisel piiravaks lisateguriks sertifitseeritud ettevõtete vähesus, mis põhjustab vigu statistilistes analüüsides.

Umbkaudsed arvestused lubavad väita, et ettevõtetel on suur arenguruum täpsemate kvaliteedieesmärkide püstitamise osas. Siin võiksid tõhusalt kaasa aidata sertifitseerimisorganite audiitorid, kes peaksid praegusest rohkem otsima töendeid pideva arengu kohta kvaliteedikulude ja -tulude arvestamise süsteemide arenemisest. Pidev areng nõub loogiliselt pidevat arengunäitajate edenemist. Finantsväärustete ebatäpne arvestamine ja samas positiivsed tulemused partnerite leidmisel näidavad, et sertifikaadi omamise rõhuasetus ja tähendus ettevõtte jaoks on nii ettevõttesisesel kui -välisel kommunikatsioonil. Sertifikaadi olemasolu loob usaldusbaasi, olles organisatsiooni jaoks eelkõige tähtis väligne tunnustus. Samas on väliste, autoriteeti omavate tunnustusskeemide valik praegu Eesti ühiskonnas liiga kitsas.

METROLOOGIA

ELEKTRIPAIGALDISTE PARAMEETRITE VÕRDLUSMÕÖTMINE

Edi Kulderknup
Eesti Akrediteerimiskeskus

1. Võrdlusmõõtmiste vajalikkus ja korraldus

Tasemeekatsed on laboritevahelise võrdluse kasutamine, et määratletud katse või kalibreerimiste osas ning võimaldada jälgida labori tulemuste vastavust ja võrreldavust. Tulemuste alusel on võimalik:

- hinnata labori võimet sooritada katset/kalibreerimist usaldavalt ja kompetentselt;
- paremini demonstreerida oma oskusi kliendile/hindajatele;
- kinnitada akrediteerimisenõuete täitmist;
- esitada riigiesindajatele tõendust;
- rakendada vajaduse korral parandusmeetmeid.

Elektripaigaliste parameetrite võrdlusmõõtmine muutus oluliseks seoses akrediteerimisenõuete esitamisega mõõtelaboritele seadusandluse (Elektriohutusseadus) poolt. Võrdlusmõõtmine viidi läbi Eesti Akrediteerimiskeskuse ja TTÜ Katsekoja poolt. Katsekoja Kalibreerimislabori ruumis elektripaigaliste imitaatori AT abil. Mõõdeti elektripaigaliste olulisemad parameetrid. Korraldamise aeg oli 02. – 09.12.2002. Mõõtmisel osalesid 25 laborit ja lõplikult vormistatud tulemused esitati Eesti Akrediteerimiskeskusesse kahe nädala jooksul pärast mõõtmist kõigi osalejate laborite poolt.

2. Mõõtmiste läbiviimine

Iga labor viis läbi mõõtmised oma meetodi alusel ja seadmetega. Mõõdeti elektripaigaliste järgmised parameetrid: rikkevoolukaitse kontroll/kaitsetagatis (näivtakistus; lühisvool I_k); kaitse- ja PEN-juhtide katkematus (takistus); isolatsioonitakistus (takistus teimipingetel 250 V, 500 V ja 1000 V); kaitse rakendusaeg (rakendumine vooludega $0,5I_{dn}$; I_{dn} ; ja $5I_{dn}$ ning faasidega 0° ja 180°) ja maandustakistus (takistus).

Imitaatoril oli tagatud:

- mõõtepunkt nr 6. $I_n = 40 \text{ A} / I_{dn} = 30 \text{ mA}$ ja mõõtepunkt nr 7. $I_n = 40 \text{ A} / I_{dn} = 100 \text{ mA}$ kaitse rakendusaja kontrollimiseks;
- mõõtepunkt nr 8. omadustega $0,5 \Omega / 2 \text{ mH}$; $1 \Omega / 1 \text{ mH}$ ja $5 \Omega / 0,2 \text{ mH}$ rikkevoolukaitse kontrollimiseks;

- mõõtepunktid nr 3. omadustega $2 \text{ M}\Omega / 5 \mu\text{H}$, 1000 V; nr 6. omadustega 4 mA ja 34 mA; 250 V ja nr 7. omadustega $1 \text{ M}\Omega$, $4 \text{ M}\Omega$ ja $4 \text{ M}\Omega$, 500 V isolatsioonitakistuse mõõtmiseks;

- pesa nr 8. omadustega $0,5 \Omega / 2 \text{ mH}$; $1 \Omega / 1 \text{ mH}$ ja $5,0 \Omega / 0,2 \text{ mH}$ kaitse- ja PEN-juhtide katkematuse kontrollimiseks;

- lülit 17. (1Ω ; 10Ω ; 100Ω ; $1 \text{ k}\Omega$; $1,8 \text{ k}\Omega$ ja $2,2 \text{ k}\Omega$) maandustakistuse mõõtmiseks. Imitaatori parameetrite väärustute liigse triivi vältimiseks viidi mõõtmised läbi nädala jooksul ning tagati ühtsed keskkonnatingimused. Kuivõrd imitaatori kaitselülitid olid elektroonsed, siis lülituste ajaline hajuvus ei tohiks ületada $10 \mu\text{s}$ ja sellest tulenev määramatus on vähene.

Imitaatori kasutamisel olid tagatud objekti vähene mõju mõõtmistele ja seetõttu oli rakendatud parima mõõtevõime mõiste kasutamine ning laboritel oli võimalus kontrollida oma parima mõõtevõime vastavust enda poolt eelnevalt deklareerituga. Laborid mõõtsid üksteisele järgnevalt ning mõõtmiseks anti ettemääratud aeg.

Korrektselt vormistatud mõõteprotokollid täideti laborite poolt hiljem.

Kokkuvõtlikud mõõte- ja arvutustulemused on esitatud:

- tabelis 1, isolatsioonitakistus;
- tabelis 2, maandustakistus;
- tabelis 3, kaitse- ja PEN-juhtide katkematuse kontroll;
- tabelis 4, rikkevoolukaitseeadmete kontroll;
- tabelis 5, kaitse rakendusaja kontroll.

3. Osavõtjad

Võrdlusmõõtmistes osalesid AS Ako Elekter, OÜ Alfard, AS BLRT ERA, AS Danite-Elekter, AS Fortum Termest, OÜ Elab; AS Elektrikontrollikeskus, AS Elektriteenused, AS Elektritsentrum, AS Elektrotherm, AS Eleväli, OÜ Elrato; OÜ Eltam Elekter, AS Elwo, AS Empower EEE; AS Erg Järva, OÜ Erko Elekter, AS E-Service, AS F-Elekter, AS KH Energia-Konsult, OÜ L.T.V.Projekt, OÜ Risaku, AS Ruubel TAM, Siemens Elektriservices AS Körgepingelabor ja AS Siivert.

4. Tulemuste töötlemise põhimõtted

Tulemused töötlesid Eesti Akrediteerimiskeskuse spetsialistid. Arvesse olid võetud laborite poolt esitatud mõõtetulemused, kuid liialt suure hälbgaga mõõtetulemusi ei arvestatud andmete statistilises töötluses selleks, et vältida keskmise tulemuse ebaõigsust.

Tulemuste hindamiseks kasutati Z parameetri arvutamise põhimõtet, kuivõrd puudusid võimalused etalonvääruse määramiseks. Mõõtetulemus on ISO Guide 43-1 järgi hea kui Z-väärus on väiksem 1 ning rahuldas kui Z-väärus on väiksem 2. Väärus Z suurem kui 3 eeldab korrigeerivate meetmete rakendamist labori poolt. Sisuliselt näitab Z arv labori taset antud mõõtmistel osalenute keskmise tulemuse suhtes ja seetõttu elektripaigaldiste mõõtmistel on vahest olulisem suhteline hälve keskmisest väärustusest ning see ei tohiks olla suurem kui üldiselt heakskiidetud väärus.

Mõõtetulemustele on arvutatud osavõtjate tulemuste aritmeetiline keskmne iga parameetri kohta valemiga:

$$D_a = \frac{\sum_{i=1}^n D_i}{n},$$

kus D_i on labori mõõtetulemus antud mõõtekohas ja n laborite arv.

Keskmise mõõtetulemuse standardhälve on arvutatud valemiga:

$$s = \sqrt{\frac{1}{n(n-1)} \sum_{i=1}^n (D_i - D_a)^2}$$

Labori mõõtetulemuse suhteline hälve keskmisest on arvutatud valemiga:

$$dx_i = \frac{D_i - D_a}{D_a} 100\%.$$

Labori Z-väärtus on arvutatud valemiga:

$$Z = \frac{D_i - D_a}{s}$$

Mõõtetulemuse suhteline hälve peaks jäama väiksemaks kui mõõtmisel laiendmääramatus, et labori tegelik mõõtetulemus saaks asetseda laborite keskväärtusel \bar{E} (vt. joon 1).

Elektripaigaldiste mõõteprotsessi määramatus tuleneb järgmistest olulistest komponentidest:

- mõõtevahendist, liitmääramatus on saadav kalibreerija andmetest u_{mi} või $u_{mi} = \Delta/2$, kus Δ on mõõteriista veapiir taatlusel;

- skaala resolutsioonist ja lugemi võtmisest $u_r = JV/\sqrt{3}$, kus JV on digitaalskaala jaotiseväärtus;

- mõõtetulemuste erinevusest mõõtmiste vähesel kordamisel $u_v = (E_{max}-E_{min})/2\sqrt{3}$, kus E_{max} ja E_{min} on mõõtetulemuse piirväärtused kogumis;

- mõõteobjekti mittehomogeensusest/-stabiilsusest u_{nh} ;

- ümbruskeskkonna mõjust u_{env} ;

- teimi ja/või toitepinge erinevusest nimiväärtusest u_t .

Antud võrdlusmõõtmiste tingimuste korral omasid arvutuslikku mõju ainult kolm esimest komponenti.

Võrdlusmõõtmise tulemuste alusel on võimalik hinnata lisaks nõ Eesti keskmist labori parimat mõõtevõimet. Võrdluskatsetel osales piisavalt suur arv osavõtjaid erinevate omadustega ja mõõteriistadega ning see tagab eeldatavasti mõõtetulemuste normaaljaotumist kokkuvõtlikult. See võimaldab leida laboritevahelist mõõtetulemuste hälvet 2 sigma tasemel, so $Z=2$ vastav hälve ongi keskmiseks parimaks mõõtevõimeks mõõteliigi osas. Antud suurus on lisatud iga tabeli lõppu.

5. Järeldused

Tabelites on küllaltki palju tulemusi, kus Z väärtus ületab 5 ning nendel laboritel tuleb kasutusele võtte konkreetsed parandusmeetmed.

Laborid esitati reeglina piisava põhjalikkusega mõõteprotokolle. Mõõteprotokollides peab nähtuma minimaalselt kõik olulised mõõteprotsessi mõjurite andmed. Mitmel juhul esines siiski andmete esitamisel ebäapsusi mõõtettingimuste esitamisel (nt kaitse rakendusmisaja katsevoolu tüübi määratlemisel).

Laborite poolt viidati kasutamisel labori enda mõõtemetoodikatele. Õigem oleks aga viidata ka üldtunnustatud (standardiseeritud) meetodile, kuivõrd labori mõõtemetoodikad on sisuliselt meetodi täpsed töökirjeldused ning meetod ei ole välja mõeldud labori enda poolt.

Kasutati erinevaid mõõtevahendeid ning üldjuhul ei nähtunud korrelatsiooni mõõtetulemuse hälbe suuruse ja kasutatud mõõteriista tüübi vahel.

Mõõtetulemust on soovitav usaldatavama tulemuse saamiseks korrata vähemalt 2 korda, mille vajalikkust nähtus ka laborite esitatud tulemustest.

Laborite poolt hinnati mõõteprotsessi määramatus, mis erinesid väärustustelt oluliselt.

Lubamatult suur on parim mõõtevõime 20 % kuni 30 % mõõtetulemusest antud tingimuste korral. Ligikaudu $\frac{1}{4}$ osavõtjatest ei olnud mõõtemääramatust hinnanud üldse.

Eelloodust nähtub, et vajalik on määramatuse hindamise oskuste parandamine.

Mõõtemääramatuse tundmine on oluline vastavushinnangu andmisel piirväärtustele lähedastel väärustel.

CEN UUDISED

Toiduainete standardimisest CEN-is

CEN on koostanud 266 toiduainete standardit, peamiselt proovivõtu ja katsemeetodite kohta, mis on välja töötatud seitsmes tehnilises komitees:

TC 174	Puu- ja juurviljamahlad. Analüüsimeetodid
TC 194	Toiduga kokkupuutuvad nõud
TC 275	Toiduainete analüüs. Horisontaalmeetodid
TC 302	Piim ja piimatooted. Analüüs- ja proovivõtu meetodid
TC 307	Õlikultuuride seemned. Loomsed ja taimsed rasvad ja õlid ning nende kõrvvalsaadused. Proovivõtu ja analüusi meetodid
TC 327	Loomasöödad. Proovivõtu ja analüusi meetodid
TC 338	Teraviljad ja teraviljatooted

CEN/TC 275 on koostanud üle 50 standardi, mis käitlevad mikrobioloogia meetodeid, raskemetallide ja lisainete sisaldust toiduainetes, toidu kiiratmise avastamist jne

Viiis CEN-i standardit kiiratuse avastamise kohta toiduainetes on üle võetud kui CODEX Alimentariuse põhimeetodid.

EN 1784:1996	Foodstuffs - Detection of irradiated food containing fat - Gas chromatography of hydrocarbons
EN 1785:1996	Foodstuffs - Detection of irradiated food containing fat - Gas chromatographic analysis of 2-alkylcyclobutanones
EN 1786:1996	Foodstuffs - Detection of irradiated food containing bone - Method by ESR spectroscopy
EN 1787:2000	Foodstuffs - Detection of irradiated food containing cellulose by ESR spectroscopy
EN 1788:2001	Foodstuffs - Thermoluminescence detection of irradiated food from which silicate materials can be isolated

Harmoneeritud standarditest

Surveseadmete direktiivi PED alusel kavandatakse muuta harmoneeritud standardite klassifikatsiooni.

Surveseadmete direktiivi juurde kuuluvad enam kui 800 standardit jagunevad käesoleval ajal alljärgnevalt:

Harmoneeritud standardid (Harmonised standards H)

Standardid, mis on koostatud EÜ/EFTA mandaadi alusel direktiivi oluliste nõuete toetuseks ning mille täitmise tulemusena saab toode CE märgistuse. Neile tootestandarditele viidatakse EÜ Ametlikus Teatajas.

Harmoneeritud tugistandardid (Harmonised supporting standards HS)

Standardid, mis on koostatud EÜ/EFTA mandaadi alusel direktiivi oluliste nõuete toetuseks, kuid mille järgi ei saa CE märgistust. Siiia kuuluvad nt materjalide ja keevituse standardid ja neile ei viidata EÜ Ametlikus Teatajas.

Tugistandardid (Supporting standards S)

Standardid, mis on koostatud EÜ/EFTA mandaadi alusel või mis on lülitatud mandaadi koosseisu ning mis on olulised vastavuse korral harmoneeritud standarditele, kuid ei täida surveseadmete direktiivi mõnda olulist ohutusnõuet. Nendele standarditele ei viidata EÜ Ametlikus Teatajas.

Edaspidi on kavas jaotada harmoneeritud standardid kaheks tüübiks.

Tüüp 1: standardid, mis pakuvad tehnilisi lahendusi spetsiifiliste oluliste ohutusnõuete täitmiseks. Need võivad olla nt toote-, materjali või personali sertifitseerimise standardid. Tüüp 1 standarditele viidatakse EÜ Ametlikus Teatajas.

Tüüp 2: Standardid, mis pakuvad kasulikke elemente oluliste ohutusnõuetete täitmise tõendamiseks, kuid ei anna omaette vastavuseeldust olulistele ohutusnõuetele. Siia kuuluvad näiteks katsestandardid, üldpõhimõtete ja terminoloogia standardid. Nendele standarditele ei avaldata viidet EÜ Ametlikus Teatajas, neid võib kasutada normatiivviidetena tüüp 1 standardites.

HARMONEERITUKS TUNNISTATUD STANDARDID

Tehnilise normi ja standardi seaduse muutmise seaduse (RT I 2002, 32, 186) kohaselt avaldab Eesti Standardikeskus oma veebilehel ja väljaandes teavet harmoneeritud standarditest.

Harmoneeritud (ühtlustatud) standardid on EL Uue lähenemisi viisi direktiividega liituvad standardid. Harmoneeritud standarditeks loetakse need standardid, millele on viidatud EL ametlikus väljaandes *Official Journal*. Harmoneeritud standardite kasutamine on kõige lihtsam viis töendada direktiivide oluliste nõuete täitmist. Lisainfo <http://www.newapproach.org/>

EVS Teatajas ja EVS kodulehel (www.evs.ee) saab tutvuda Uue lähenemisi viisi direktiivide all harmoneeritud standarditega. Ühtlasi avaldamine ka, millised neist standarditest on üle võetud Eesti standarditeks. Seekord on avaldatud **ehitustoodete, lõbusöidulaevade, elektromagnetilise ühilduvuse ja meditsiinivahendite** standardid (avaldatud detsembri 2002 ja veebruari 2003 Euroopa Ühenduste Teataja C-seerias).

Kõik seekord viidatud standardid on üle võetud Eesti standarditeks.

UUED STANDARDID JA KAVANDID ARVAMUSKÜSITLUSEKS

See EVS Teataja osa avaldab andmed uutest vastuvõetud Eesti standarditest ja avalikuks arvamusküsitleuseks esitatud standardite kavanditest Rahvusvahelise standardite klassifikaatori (ICS) järgi.

Samas jaotises on toodud andmed nii eesti keeles avaldatud kui ka jõustumisteatega Eesti standarditeks ingliskeelsetena vastuvõetud rahvusvahelistest ja Euroopa standarditest. Kuna võimalusel on ingliskeelsena vastuvõetud standardi nimetus ja käsitlusala tõlgitud eesti keelde ja loetelust ei ole see eristatav, millised standardid on tõlgitud eesti keelde, on eesti keeles avaldatud standardid toodud ka eraldi nimekirjana Teataja lõpus.

Eesmärgiga tagada standardite vastuvõtmine järgides konsensuse põhimõtteid, peab standardite vastuvõtmisele eelnema standardite kavandite avalik arvamusküsitus, milleks ettenähtud perioodi jooksul on asjasthuvitatuil võimalik tutvuda standardite kavanditega ning teha ettepanekuid.

EVS Teatajas on esitatud arvamusküsitleusele:

- 1) Euroopa ja rahvusvahelised standardid, mis on kavas vastu võtta Eesti standarditeks jõustumisteatega (kavandid kättesaadaval standardina inglise keeles EVS raamatukogus ja neid saab osta müügigrupist; EVS tehnilikatel komiteedel on võimalik saada koopiaid oma käsitlusalaga kokkulangevatest standarditest EVS kontaktisiku kaudu);

- 2) Eesti standardite kavandid, mis Eesti standardimisprogrammi järgi on jõudnud arvamusküsitleuse etappi (kavandid on kättesaadavad eesti keeles standardiosakonnas, neid saab osta müügigrupist);
- 3) Euroopa (prEN) standardite kavandid, mis on saadetud liikmetele arvamusküsitleuseks (kavandid on kättesaadavad EVS raamatukogus, v.a Euroopa standarditeks ülevõetavate nende ISO tehniliste komiteede kavandid (prEN ISO), mille töös EVS ei osale, ja neid saab osta müügigrupist. EVS tehnilikatel komiteedel on võimalik saada koopiaid oma käsitlusalaga kokkulangevatest kavanditest EVS kontaktisiku kaudu).

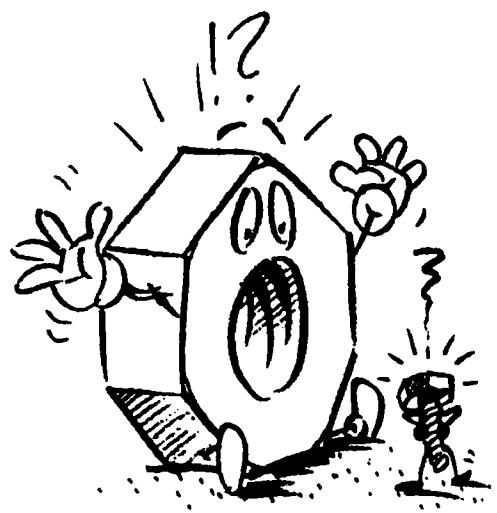

EVS Teatajas on kavandid identifitseeritud sellele standardite andmebaasis omistatud projekti numbri järgi (nt prEVS 18958), kavandite saamiseks on soovitatav ära näidata ka kavandiga identse standardi tähis. Teavet Eesti standardimisprogrammist saab standardiosakonnast.

Kavandite arvamusküsitusel on eriti oodatud teave, kui rahvusvahelist või Euroopa standardit ei peaks vastu võtma Eesti standardiks (vastuolu Eesti õigusaktidega, pole Eestis rakendatav jt põhjustel).

Hind 126,00

Identne EN 50370-2:2003

Electromagnetic compatibility (EMC) - Product family standard for machine tools - Part 2: Immunity

This standard deals with the electromagnetic immunity of machine tools designed exclusively for industrial and similar purposes that use electricity, the rated voltage of the machine tool not exceeding 1 000 V a.c. or 1 500 V d.c. between lines. Machine tools may incorporate motors, heating elements or their combination, may contain electric or electronic circuitry, and may be powered by the mains, or any other electrical power source. This immunity standard may also be used for assessment of equipment used in other environments, which require less stringent immunity levels (residential, light industry) than the industrial environment. This standard is not intended for the EMC conformity assessment of modules to be placed on the market separately. This standard is not intended for complying with Machinery Directive 98/37/EC. Hence safety considerations are not covered by this standard. This standard does not cover fixed installations as defined in the Guide to the Application of Directive 89/336/EEC, published by the European Commission.

This standard does not apply to apparatus intended to be used in locations where special

electromagnetic conditions prevail, such as the presence of high electromagnetic fields (e.g. in the vicinity of a broadcast transmitting station) or where high pulses occur on the power network (e.g. in a power generator station). In these instances special mitigation measures may have to be employed. Immunity requirements in the frequency range 0 Hz to 400 GHz are covered. No measurements need to be performed at frequencies where no

Stationary lead-acid batteries - Part 11: Vented types - General requirements and methods of tests

This part of IEC 60896 is applicable to lead-acid cells and batteries which are designed for service in fixed locations (i.e. not habitually to be moved from place to place) and which are permanently connected to the load and to the d.c. power supply.

Batteries operating in such applications are called "stationary batteries". Any type or construction of lead-acid battery may be used for stationary battery applications. This part 11 of the standard is applicable to vented types only. This first edition of IEC 60896-11 cancels and replaces IEC 60896-1 (first edition) published in 1987 and its amendments 1 (1988) and 2 (1990), and constitutes a technical revision.

Railway applications - Environmental conditions for equipment - Part 2: Fixed electrical installations

This standard defines influences from the surroundings on fixed electrical installations in open air, in covered areas, tunnels and within cubicles placed in above areas. Such influences include altitude, temperature & humidity, air movement, rain, snow, hail, ice, sand, solar radiation, lightning, pollution and vibrations. In this respect it gives general guidance in order to allow the fairness of bid assessments and the process of railway projects. The environmental conditions are considered for normal operation.

More severe conditions may be specified for the equipment to withstand, when not operating, without suffering damage. Microclimates surrounding components may need special requirements which are covered by product standards. In case of environmental conditions not covered by the standard the data to be adopted for a specific project shall be clearly stipulated when preparing a specification. This standard is not intended to apply to cranes, installations in underground mines, suspended cable cars and funicular railways. Biological influences, EMC, electromagnetic interference and nuclear radiation are excluded. Signalling and telecommunications systems are not considered in this standard. Equipment in tunnels will include the running tunnel and the platform together with fixed equipment essential to operate the railway. Not included will be escalators, lifts, fire protection, lighting in tunnels and on platforms, ticket machines, toilets and ventilation systems.

Radio disturbance characteristics for the protection of receivers used on board vehicles, boats, and on devices - Limits and methods of measurement

This standard is designed to protect receivers from disturbances produced by conducted and radiated emissions arising in a vehicle. Test procedures and limits given are intended to provide provisional control of vehicle-radiated emissions, as well as component/module conducted/radiated emissions of long and short duration. The standard: - establishes a test method for measuring the electromagnetic emissions from the electrical system of a vehicle; - sets limits for the electromagnetic emissions from the electrical system of a vehicle; - establishes test methods for testing on-board components and modules independent from the vehicle; - sets limits for electromagnetic emissions from components to prevent objectionable disturbance to on-board receivers; - classifies automotive components by disturbance duration to establish a range of limits.

Electromagnetic compatibility (EMC) - Product family standard for machine tools - Part 2: Immunity

This standard deals with the electromagnetic immunity of machine tools designed exclusively for industrial and similar purposes that use electricity, the rated voltage of the machine tool not exceeding 1 000 V a.c. or 1 500 V d.c. between lines. Machine tools may incorporate motors, heating elements or their combination, may contain electric or electronic circuitry, and may be powered by the mains, or any other electrical power source. This immunity standard may also be used for assessment of equipment used in other environments, which require less stringent immunity levels (residential, light industry) than the industrial environment. This standard is not intended for the EMC conformity assessment of modules to be placed on the market separately. This standard is not intended for complying with

Machinery Directive 98/37/EC. Hence safety considerations are not covered by this standard. This standard does not cover fixed installations as defined in the Guide to the Application of Directive 89/336/EEC, published by the European Commission. This standard does not apply to apparatus intended to be used in locations where special electromagnetic conditions prevail, such as the presence of high electromagnetic fields (e.g. in the vicinity of a broadcast transmitting station) or where high pulses occur on the power network (e.g. in a power generator station). In these instances special mitigation measures may have to be employed. Immunity requirements in the frequency range 0 Hz to 400 GHz are covered. No measurements need to be performed at frequencies where no

Infotehnoloogia. Sõnastik.

Osa 37: Virtuaalreaalsus

Standard on mõeldud soodustama rahvusvahelist suhtlust infotehnoloogias. Ta esitab infotehnoloogia valdkonna jaoks oluliste valitud mõistete terminid ja määratlused kahes keeles ning määratleb artiklite vahelised seosed. Teistesse keeltesse tõlkimise hõlbustamiseks on määratlused kavandatud nii, et võimalikult välistada ühele keelele omaseid iseärasusi. Standard määratleb virtuaalreaalsusega seotud mõisteid.

Information technology equipment - Radio disturbance characteristics - Limits and methods of measurement

This standard applies to ITE as defined in 3.1. Procedures are given for the measurement of the levels of spurious signals generated by the ITE and limits are specified for the frequency range 9 kHz to 400 GHz for both Class A and Class B equipment. No measurements need to be performed at frequencies where no limits are specified.

Product package labels for electronic components using bar code and two-dimensional symbologies

Applies to labels on the packaging of electronic components for automatic handling. These labels use linear bar code and two-dimensional (2D) symbols. Bar code and 2D symbols markings are used, in general, for automatic identification and handling of components in electronics assembly lines. Intended applications include systems that automate the control of component packages during production, inventory and internal distribution

**Consumer audio/video
equipment - Digital interface -
Part 6: Audio and music data
transmission protocol**
This document defines the audio and music data transmission protocol as an instance of a real-time data transmission protocol to be standardized under IEC 61883-1/FDIS in the future. The audio and music data transmission protocol can be applied to all modules or devices which have any kind of audio and/or music data processing, generation and conversion function blocks. This specification deals only with the transmission of audio and music data; the control, status and machine readable description of these modules or devices should be defined outside of this specification according to each application area.

Hind 179,00

Identne IEC 60335-2-96:2002

ja identne EN 60335-2-96:2002

Safety of household and similar electrical appliances - Part 2-96: Particular requirements for flexible sheet heating elements for room heating

Deals with the safety of flexible sheet heating elements. These are incorporated into a building to heat rooms. The rated voltage is less than 250 V for single-phase installations and 480 V for other installations. For heated blankets and pads, see IEC 60335-2-17. For heated mats and foot warmers, see IEC 60335-2-81. This standard does not cover under-carpet heaters, nor flexible heating elements incorporated in other appliances.

Identne EN 649:1996/prA1:2003

Elastsed põrandakatted.

Homogeensed ja heterogeensed polüvinüülkloriidist põrandakatted. Tehnilised andmed

This Standard specifies the characteristics of homogeneous and heterogeneous floor coverings, based on polyvinyl chloride and modifications thereof, supplied in either tile or roll form. To encourage the customer to make an informed choice, the standard includes a classification system (see EN 685) based on intensity of use, which shows where these floor coverings should give satisfactory service. It also specifies requirements for marking
